This document contains suggested enhancements to the Advanced Library Format, using ALF 2.0 as baseline. The document serves as a worksheet rather than a formal proposal. The suggested enhancements are collected in no particular order. The idea is to keep track of evolving proposals here and then agree formally whether or not they should be part of the IEEE spec.

The following template is used throughout this document:

X.0 Item

relation to ALF 2.0 reference to ALF 2.0 chapter

relation to IEEE P1603 reference to IEEE P1603 chapter

History date of initial draft, date of revisions

X.1 Motivation

Explain reason for new feature

X.2 Proposal

Describe new feature

1.0 Level definition for Vector Expression Language

relation to ALF 2.0 5.3, 5.4, 11.3

relation to IEEE P1603 N/A

History initial draft April 16 2001 by Wolfgang
reviewed and rejected by Study Group April 16
rejection confirmed by Tim Ehrler May 1
changed title and closed May 4 by Wolfgang

1.1 Motivation

The vector expression language is a new concept which has almost no equivalent in legacy library model description languages. Currently there are EDA tools which support a subset of the vector expression language. Purpose of this proposal is to re-write the definitions in such a way that it is easy to identify subsets for different levels of support. For example: level0=basic subset, level1=intermediate subset, level2=full set in ALF 2.0, level3=full set in ALF 2.0 plus new proposed extensions.

1.2 Proposal

Level 0: single event, single event & boolean condition, two-event sequence

Level 1: N-event sequence, N-event sequence & boolean condition, alternative event sequence

Level 2: everything in ALF 2.0 (except if we decide to drop something fundamentally unpractical or un-implementable)

Level 3: new operators for repetition of sub-sequences

2.0 Metal Density

relation to ALF 2.0 9.2, 9.5

relation to IEEE P1603 11.13

History initial draft April 16 2001 by Wolfgang
reviewed and retained by Study Group April 16
o.k. as is by Tim Ehrler May 1
supplementary proposal by Wolfgang Oct. 5
reviewed Oct. 9, supplementary proposal o.k.

2.1 Motivation

Manufacturability in 130 nm technology and below requires so-called metal density rules. For a given routing layer, metal must cover a certain percentage of the total area within a lower and upper bound in order to ensure planarity. This percentage also depends on the total area under consideration, i.e., there are “local” and “global” metal density rules.

Manufacturing rules also specify, how density should be calculated. For example, only structures wider than a certain minimum width should be taken into account.

Also, for local rules, the shape of the region to be checked can be specified. For example, check the rule on a square of x*x mm^2, check the density on a region of x mm width in X or Y direction etc.

2.2 Proposal

Introduce new keyword DENSITY (or other word) for arithmetic model. Shall be non-negative number normalized between 0 and 1 (1 means 100%). Usable in context of LAYER (see ALF 2.0, chapter 9.5.1) with PURPOSE=routing (see ALF 2.0, chapter 9.5.2). Legal argument (i.e. HEADER) includes AREA, meaning the die area subjected to manufacturing of this layer.

Example:

```
LAYER metal1 {
   PURPOSE = routing;
   LIMIT {
      DENSITY {
         MIN {
            HEADER {
               AREA {
                  INTERPOLATION = floor;
                  TABLE { 0 100 1000 }
               }
            }
            TABLE { 0.2 0.3 0.4 }
```

```
         }
         MAX {
            HEADER {
               AREA {
                  INTERPOLATION = floor;
                  TABLE { 0 100 1000 }
               }
            }
            TABLE { 0.8 0.7 0.6 }
         }
      }
   }
}
```

Within an area of less than 100 units, the metal density must be between 20% and 80%. Within an area of 100 up to less than 1000 units, the metal density must be between 30% and 70%. Within an are of 1000 units or more, the metal density must be between 40% and 60%. The annotation INTERPOLATION=floor indicates that no interpolation is made for areas in-between, but the next lower value is used (see ALF 2.0, chapter 7.4.4).

To allow for particularities in density calculation, the DENSITY statement must be in context of a RULE (see ALF 2.0, chapter 9.11). The applicable layer is given as annotation. Both a model for calculation of DENSITY and a model for the limit of DENSITY must be given in context of the RULE.

Example:

```
RULE min_density {
   DENSITY {
      LAYER = metal1;
      CALCULATION = incremental;
      HEADER {
         WIDTH
         LENGTH
         AREA
      }
      EQUATION { WIDTH * LENGTH / AREA }
   }
   LIMIT { DENSITY { LAYER = metal1; MIN = 0.2; } }
}
RULE max_density {
   DENSITY {
      LAYER = metal1;
      CALCULATION = incremental;
      HEADER {
         WIDTH
         LENGTH
         AREA
      }
      EQUATION { (WIDTH<0.1)? 0 : WIDTH * LENGTH / AREA }
   }
   LIMIT { DENSITY { LAYER = metal1; MAX = 0.8; } }
}
```

Note: WIDTH (see ALF 2.0, chapter 9.2, table 9-4) and LENGTH (see ALF 2.0, chapter 9.2, table 9-6) are the dimensions of a routable object in the layer. AREA (see ALF 2.0, chapter 9.2, table 9-7) should be defined as the area of the environment in this context.

The example specifies, that objects smaller than 0.1 units of WIDTH are to be disregarded for DENSITY calculation in context of the RULE max_density.

3.0 Current types

relation to ALF 2.0 8.1, 8.7, 8.15

relation to IEEE P1603 11.12.5, 11.12.11

History initial draft April 162001 by Wolfgang
reviewed and retained by Study Group April 16
also reviewed by Tim Ehrler May 1
add text to clarify purpose by Wolfgang May 4
proposal reviewed May 8, added supplementary proposal
reviewed, amended and accepted Oct. 9

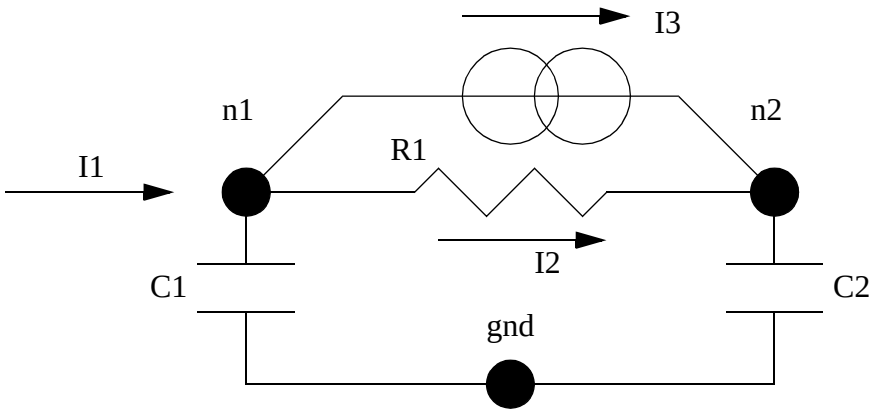
3.1 Motivation

CURRENT needs PIN annotation indicating the target point where the current is flowing into. Cannot define a branch of an electrical network where the current flows through.

Therefore there will be 3 types of CURRENT specification:

I1 = current into PIN from unspecified source (already supported in ALF 2.0)
I2 = current through a COMPONENT with two terminal nodes
I3 = current through an independent current source connected between two NODEs

see I1, I2, I3 in illustration



3.2 Proposal

In the context of WIRE, the following mutually exclusive annotations for CURRENT shall be legal:

```
PIN = pin_identifier ;
```

Current flows from unknown source into the pin (already supported).

```
COMPONENT = component_identifier ;
```

Current flows through the component. The component must be a declared two-terminal electrical component in the context of the WIRE, i.e. a RESISTANCE, CAPACITANCE, VOLTAGE or INDUCTANCE (excluding mutual inductance, which has 4 terminals). The direction of the current flow is given by the order of node identifiers in the NODE annotation for that component (see ALF 2.0, chapter 8.15.3, 8.15.4).

```
NODE { 1st_node_identifier 2nd_node_identifier }
```

Current flows through a current source connected between the nodes. The direction of the current flow is given by the order of node identifiers in this NODE annotation.

Example:

```
WIRE interconnect_analysis_model_1 {
   CAPACITANCE C1 { NODE { n1 gnd } }
   CAPACITANCE C2 { NODE { n2 gnd } }
   RESISTANCE  R1 { NODE { n1 n2  } }
   CURRENT I1 { PIN = n1; }
   CURRENT I2 { COMPONENT = R1; }
   CURRENT I3 { NODE { n1 n2 } }
}
```

This example corresponds exactly to the illustration shown above.

3.3 Supplementary proposal

According to ALF 2.0, chapter 8.7.3, the sense of measurement for current associated with a pin shall be *into* the node. However, in some cases, the natural sense of measurement is *out of* the node. In order to allow explicit specification of the sense of measurement, the following feature is proposed:

FLOW annotation for current shall specify the sense of measurement of current. Default value shall be “in”, which is backward compatible with ALF 2.0.

```
FLOW = in | out;
```

For example, the following two statements are equivalent:

```
CURRENT I1 = 3.0 { PIN = n1; FLOW = in; }

CURRENT I1 = -3.0 { PIN = n1; FLOW = out; }
```

This is illustrated in the picture below.

4.0 Noise

relation to ALF 2.0 8.1, 8.14

relation to IEEE P1603 11.12.10

History initial draft April 16 2001 by Wolfgang
o.k by Tim Ehrler May 1
updated by Wolfgang May 4
reviewed and updated (see minutes) May 8
reviewed and accepted Oct. 9

4.1 Motivation

NOISE_MARGIN defines a normalized voltage difference between nominal signal level and tolerated signal level. If violated, the correct signal level can not be determined. In order to check against noise margin, actual noise must be calculated. Currently VOLTAGE is used for noise calculations. However, since noise margin is normalized to signal voltage swing, it would be convenient, if the actual noise could also be represented in a normalized way. In CMOS, actual noise and noise margin tend to scale with supply voltage. A non-normalized model requires supply voltage as a parameter, if the supply voltage is subject to variation. A normalized model would to a 1st order degree approximate the voltage scaling effect already and therefore eliminate the supply voltage as a model parameter.

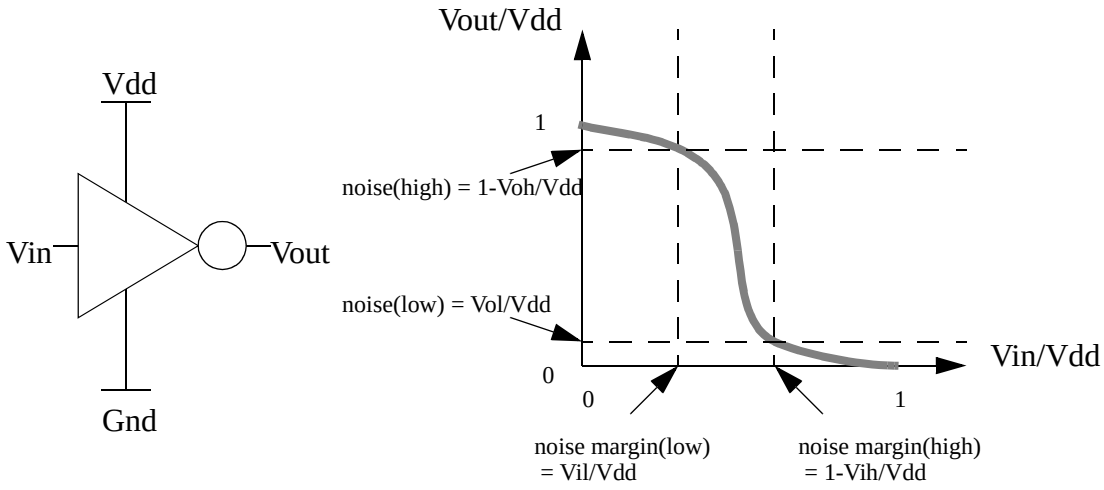
4.2 Proposal

Introduce new keyword NOISE, representing a normalized voltage difference between nominal signal level and actual signal level. Same measurement definition as for noise margin (see ALF 2.0, chapter 8.14). Noise margin is violated, if noise is larger than noise margin.

Context-specific meaning of NOISE

1. Context is output or bidirectional PIN

NOISE specifies maximum amount of noise at output pin, when any input pin is subjected to the amount of noise specified by NOISE_MARGIN. NOISE may have submodel HIGH and LOW. The relation between noise at output pin and noise margin at input pin is illustrated in the following picture.



Example:

```
PIN my_input_pin {
   DIRECTION = input;
   NOISE_MARGIN { HIGH = 0.3; LOW = 0.2; }
}
PIN my_output_pin {
   DIRECTION = output;
   NOISE { HIGH = 0.02; LOW = 0.01; }
}
```

2. Context is VECTOR with `vector_expression`

NOISE needs PIN annotation. NOISE specifies peak noise while pin is in “*” state. NOISE may only have submodel HIGH and LOW, if “?” state as opposed to “0” or “1” state is specified in vector_expression.

Example:

```
VECTOR ( 0* my_pin -> *0 my_pin) {
   NOISE = 0.2 { PIN = my_pin; }
}
```

3. Context is CELL, SUBLIBRARY, or LIBRARY

no PIN annotation. NOISE specifies maximum amount of noise at any output or bidirectional pin within scope, unless this specification is overwritten locally.

Example:

```
LIBRARY my_library {
   NOISE { HIGH = 0.02; LOW = 0.01; }
}
```

5.0 Non-scan cell

relation to ALF 2.0 6.2, 11.2

relation to IEEE P1603 9.2.2

History initial draft April 16 2001 by Wolfgang
o.k. by Tim Ehrler May 1
accepted and closed per default Oct. 9

5.1 Motivation

Non-scan cell defines the mapping between the pins of a non-scan cell (left-hand side) and the pins of a scan cell (right-hand side). The scan cells has always certain pins which do not exist in the non-scan cell. In some cases, the non-scan cell might have certain pins which do not exist in the scan cell (In such a case, the scan replacement can only be done, if the pin in question was tied to an inactive level in the non-scan cell in the first place).

Currently, the non-scan cell statement supports definition of LHS or RHS constants which specify the logic level to which the non-corresponding pins should be tied to. However, this definition is redundant, because every relevant pin in a cell model must have annotations for SIGNALTYPE and POLARITY in order to be usable for DFT tools. These annotations specify already the logic level to which non-corresponding pins must be tied.

5.2 Proposal

Reduce syntax for pin_assignment (see ALF 2.0, chapter 11.2) to the following:

```
pin_assignment ::=
   pin_identifier [ index ] = pin_identifier [ index ] ;
|  pin_identifier [ index ] = logic_constant ;
```

Only “ `pin_identifier [ index ] = pin_identifier [ index ] ;` “ will actually be used for non-scan cell. Since POLARITY defines the active signal level, the pin should be tied to the opposite level. For pins without POLARITY, the level does not matter (e.g. scan input for scan flip-flop in non-scan mode).

Example (taken from ALF 2.0, chapter 6.2):

```
CELL my_flipflop {
   PIN q   { DIRECTION=output; } // SIGNALTYPE defaults to “data”
   PIN d   { DIRECTION=input; } // SIGNALTYPE defaults to “data”
   PIN clk { DIRECTION=input; SIGNALTYPE=clock; POLARITY=rising_edge; }
   PIN clear { DIRECTION=input; SIGNALTYPE=clear; POLARITY=low; }
}
CELL my_scan_flipflop {
   PIN data_out { DIRECTION=output; } // SIGNALTYPE defaults to “data”
   PIN data_in  { DIRECTION=input; } // SIGNALTYPE defaults to “data”
   PIN scan_in  { DIRECTION=input; SIGNALTYPE=scan_data; }
```

```
   PIN scan_sel { DIRECTION=input; SIGNALTYPE=scan_control;
      POLARITY { SCAN=high; } } // scan mode when 1, non-scan mode when 0
   PIN clock {DIRECTION=input; SIGNALTYPE=clock; POLARITY=rising_edge;}
   NON_SCAN_CELL {
      my_flipflop {
         clk = clock;
         d   = data_in;
         q   = data_out;
      }
   }
}
```

The scan replacement works only, if the **clear** pin of **my_flipflop** is tied high (active level is low). Note: This is an exceptional case and only shown because it might happen eventually. Normally, the pins of the scan cell represent a superset of the pins of the non-scan cell.

In order to simulate the non-scan mode, when the non-scan cell is replaced by the scan cell, the **scan_sel** pin of **my_scan_flipflop** must be tied low (scan mode level is high). The **scan_in** pin can be tied to either high or low.

This example shows that the constant logic levels need not be defined in the non-scan cell statements, because they can be completely inferred from the POLARITY statements. The POLARITY statements are mandatory for DFT tools anyway.

6.0 VIOLATION in context of LIMIT

relation to ALF 2.0 7.5, 7.6, 8.4

relation to IEEE P1603 9.10.5, 11.6.4

History Proposal May 1 by Tim Ehrler
written in doc May 4 by Wolfgang
reviewed and updated (see minutes) May8
reviewed, accepted and closed Oct. 9

6.1 Motivation

Want to specify level of severity, if a LIMIT is violated. Target is appropriate error report from tool.

6.2 Proposal

The VIOLATION statement may appear within the context of an arithmetic model within LIMIT or an arithmetic submodel within LIMIT.

In this context, a MESSAGE_TYPE annotation or a MESSAGE annotation or both shall be legal within VIOLATION. A BEHAVIOR statement within VIOLATION shall only be legal if the LIMIT is within the context of a VECTOR. In the latter case, the `vector_expression` or `boolean_expression` which identifies the VECTOR shall define the triggering condition for the behavior described in the BEHAVIOR statement.

7.0 New value for MEASUREMENT annotation

relation to ALF 2.0 8.9.1

relation to IEEE P1603 11.12.11

History Proposal by Wolfgang, May 22
reviewed June 27, o.k. July 10 (see minutes)
accepted and closed Oct. 9

7.1 Motivation

Currently, measurements of analog quantities can be specified as “average”, “rms”, “peak”, “transient”, “static”. Another commonly used measurement is the average over absolute values, which cannot be specified.

7.2 Proposal

The MEASUREMENT annotation shall support the following values:

```
MEASUREMENT =
   transient
|  static
|  average
|  rms
|  peak
|  absolute_average[1]
```

The mathematical definition of **absolute_average** is the following[2]: $\frac{\int_{(t=0)}^{(t=T)} |E(t)|dt}{T}$

1. everything except **absolute_average** is already supported in ALF 2.0
2. Note: The parentheses around (t = 0) and (t = T) are an artefact of the framemaker equation editor.

8.0 MONITOR statement for VECTOR

relation to ALF 2.0 5.3.7, 5.4, 6.4.16

relation to IEEE P1603 9.5.3

History Proposal by Wolfgang, May 22
reviewed July 10 (see minutes)
reviewed Oct. 9, added comments based on discussion

8.1 Motivation

Any `vector_expression` in the context of a VECTOR has an associated set of variables, which are monitored for the purpose of evaluating the `vector_expression`. The set of variables is given by the set of declared PINs, featuring a SCOPE annotation.

```
SCOPE = behavior | measure | both | none ; // see ALF 2.0, chapter 6.4.16
```

In the context of a VECTOR, all PINs with **`SCOPE = measure | both`** are monitored. Sometimes it would be practical to reduce the set of monitored pins within the scope of a particular vector. For example, in a multiport RAM, only the pins associated with a particular logical port should be monitored, if the `vector_expression` describes a transaction involving only this port. Currently, this can only be achieved by applying the "?*" operator to all unmonitored pins. Therefore the `vector_expression` can become quite lengthy for complex cells.

8.2 Proposal

Note: To understand and appreciate the proposal, it is mandatory that the reader be familiar with ALF 2.0, chapter 5.4, pp. 55-80.

A VECTOR identified by a `vector_expression` may have the following MONITOR annotation:

```
monitor_multivalue_annotation :==
   MONITOR { pin_identifiers }
```

The set of *`pin_identifiers`* shall be a subset of pins with **`SCOPE = measure | both`** .

If the MONITOR annotation is present, all pins appearing within this annotation shall be monitored. Any pin appearing in the `vector_expression` must also appear in the MONITOR annotation. However, all pins appearing in the MONITOR annotation need not appear in the `vector_expression`.

If the MONITOR annotation is not present, all pins with **`SCOPE = measure | both`** shall be monitored (backward compatible with ALF 2.0).

Example:

```
CELL my_4_bit_register_file {
   PIN clk { DIRECTION=input; }
   PIN [4:1] din  { DIRECTION=input; }
   PIN [4:1] dout { DIRECTION=output; }
   VECTOR ( 01 clk -> ?! dout[1] ) {
      MONITOR { din[1] dout[1] clk } // put in delay, power etc.
   }
   VECTOR ( 01 clk -> ?! dout[2] ) {
      MONITOR { din[2] dout[2] clk } // put in delay, power etc.
   }
   VECTOR ( 01 clk -> ?! dout[3] ) {
      MONITOR { din[3] dout[3] clk } // put in delay, power etc.
   }
   VECTOR ( 01 clk -> ?! dout[4] ) {
      MONITOR { din[4] dout[4] clk } // put in delay, power etc.
   }
}
```

It has been suggested that the MONITOR statement should only contain the variables which are not already present in the vector_expression. This has the following drawback: A vector_expression with all monitored variables present would need an empty MONITOR statement in order to be compatible with ALF 2.0 semantics. Also, identification of the full set of monitored variables would not be possible without analysis of the vector expression. It was argued that specifying all variables is redundant and inconvenient. However, the latter applies only if both the vector_expression and the MONITOR statement are specified by hand. Eventually, a user may specify only a set of MONITOR statements and leave the generation of appropriate vector_expressions to an intelligent characterization tool. The redundancy between MONITOR statement and vector_expression could also serve as a validity check especially for automatically generated vector_expressions. Discussion to be continued ...

9.0 Make grammar more compact by removing redundancies

relation to ALF 2.0 3.2, 11.x

relation to IEEE P1603 Annex A (normative)

History Proposal by Wolfgang, May 22
review pending as of July 10
Comments from Tim Ehrler per email:
no issue with proposed changes
left open for review by other ALF parser developpers

9.1 Motivation

Simplify the grammar by getting rid of redundant definitions. Definitions which are used in a particular context should be presented in that context. This will also simplify to introduce grammar “snippets” in the semantic sections, where they are needed.

9.2 Proposal

ALF 2.0 chapter 11.2

Get rid of chapter 11.2 and introduce the pertinent statements locally, where they are needed.

`unnamed_assignment_base`
remove

`unnamed_assignment`
rename to `single_value_annotation`, move to 11.7

`named_assignment_base`
remove

`named_assignment`
remove

```
single_value_assignment ::=
   identifier = value ;
```

`multi_value_assignment`
rename to `multi_value_annotation`, move to 11.7

`assignment`
remove

`pin_assignment`
modify according to chapter 5 of this doc., move to 11.7

`arithmetic_assignment`
move to 11.7

ALF 2.0 chapter 11.3

split into 3 separate chapters:

- Boolean expressions and operators
  put `boolean_expression`
- Arithmetic expressions and operators
  put `arithmetic_expression`
- Vector expressions and operators
  put everything else

ALF 2.0 chapter 11.4

Get rid of chapter 11.4 and introduce the pertinent statements locally, where they are needed.

`cell_instantiation`
remove

`unnamed_cell_instantiation`
only used for NON_SCAN_CELL, move to 11.9

`named_cell_instantiation`
only used for STRUCTURE, move to 11.17

`pin_instantiation`
only used for PIN, move to 11.11

Error to be corrected:
incorrect use of `pin_instantiation` in chapter 6.3, should be `pin_assignments`

Error to be corrected:
`pin_instantiation` is not mentioned as `pin_item` in chapter 11.11

`primitive_instantiation`
only used for FUNCTION, move to 11.17

`template_instantiation`
move to 11.7

`dynamic_instantiation_item`
move to 11.7

`via_instantiation`
move to 11.23

ALF 2.0 chapter 11.5

move to “lexical rules” section (chapter 10)

ALF 2.0 chapter 11.6

Get rid of chapter 11.6, associate operators with the corresponding expressions.

- Boolean expressions and operators
  put all operators with prefix `boolean_`
- Arithmetic expressions and operators
  put all operators with prefix `arithmetic_`
- Vector expressions and operators
  put all operators with prefix `vector_`

move `sequential_if`, `sequential_else_if` to 11.17.

ALF 2.0 chapter 11.7

rename `logic_assignment` (see 11.17) into `boolean_assignment` and move into 11.7. Move `vector_assignment` into 11.7.

rewrite grammar involving `all_purpose_item`, `annotation`, `annotation_container`, the other items remain unchanged.

```
annotation ::=
   one_level_annotation
|  two_level_annotation
|  multi_level_annotation

one_level_annotation ::=
   single_value_annotation
|  multi_value_annotation

one_level_annotations ::=
   one_level_annotation { one_level_annotation }

two_level_annotation ::=
   one_level_annotation
|  identifier [ = value ] { one_level_annotations }

two_level_annotations ::=
   two_level_annotation { two_level_annotation }

multi_level_annotation ::=
   one_level_annotation
|  identifier [ = value ] { multi_level_annotations }
```

```
multi_level_annotations ::=
   multi_level_annotation { multi_level_annotation }

annotation_container ::=
   identifier { one_level_annotations }
```

Since `all_purpose_item` allows `generic_object` and `generic_object` includes `keyword_declaration` statement, consequently all *`syntax_item`*`_identifiers` that can be used by `keyword_declaration` (see chapter 3.2.9) must be covered by `all_purpose_item`.

```
all_purpose_item ::=
   generic_object
|  template_instantiation
|  annotation
|  arithmetic_model
|  arithmetic_model_container
|  boolean_assignment
|  vector_assignment
```

Error to be corrected:
`boolean_assignment` is not mentioned as *`syntax_item`*`_identifier` in chapter 3.2.9.

Note: `arithmetic_submodel` is also a *`syntax_item`*`_identifier`, but it is not included in `all_purpose_item`, because `arithmetic_submodel` is always in the context of `arithmetic_model`.

10.0 Rewrite grammar for more specific syntax and less semantic restriction

relation to ALF 2.0	3.2, 11.x
relation to IEEE P1603	Annex A (normative)
History	Proposal by Wolfgang, May 22 review pending as of July 10 Comments from Tim Ehrler per email: no issue with proposed changes *left open for review by other ALF parser developpers*

10.1 Motivation

Certain syntax definitions of ALF are written in a very generic way. As a consequence, a lot of semantic restrictions apply. The idea is to rewrite the grammar so that the syntax section becomes more specific and as a consequence the semantic sections become less “heavy”. However, the changes to the existing grammar should be limited to modifications which specifically serve that purpose rather than re-writing the whole grammar from scratch. Also, eventual redundancy in the grammar can be eliminated.

10.2 Proposal

Use `all_purpose_item` only for statements with custom keywords, introduced by `keyword_declaration` statements and put the statements using standard keywords explicitly in the grammar.

ALF 2.0 Chapter 11.9

```
cell_item ::=
   all_purpose_item
|  CELLTYPE_single_value_annotation
|  SWAP_CLASS_one_level_annotation
|  RESTRICT_CLASS_one_level_annotation
|  SCANTYPE_single_value_annotation
|  SCAN_USAGE_single_value_annotation
|  BUFFERTYPE_single_value_annotation
|  DRIVERTYPE_single_value_annotation
|  PARALLEL_DRIVE_single_value_annotation
|  pin
|  pin_group
|  primitive
|  function
|  non_scan_cell
|  test
|  vector
|  wire
|  blockage
```

```
|  artwork
|  connectivity
```

ALF 2.0 Chapter 11.10

```
library_item ::=
   all_purpose_item
```

ALF 2.0 Chapter 11.11

```
pin_item ::=
   all_purpose_item
|  range
|  VIEW_single_value_annotation
|  PINTYPE_single_value_annotation
|  DIRECTION_single_value_annotation
|  SIGNALTYPE_single_value_annotation
|  ACTION_single_value_annotation
|  POLARITY_two_level_annotation
|  DATATYPE_single_value_annotation
|  INITIAL_VALUE_single_value_annotation
|  SCAN_POSITION_single_value_annotation
|  STUCK_single_value_annotation
|  SUPPLYTYPE_single_value_annotation
|  SIGNAL_CLASS_one_level_annotation
|  SUPPLY_CLASS_one_level_annotation
|  cell_pin_reference_two_level_annotation
|  DRIVETYPE_single_value_annotation
|  SCOPE_single_value_annotation
|  PULL_single_value_annotation
|  port
|  connectivity
|  pin_instantiation // this one is missing in chapter 11.11
```

ALF 2.0 Chapter 11.14

```
vector_item ::=
   all_purpose_item
|  PURPOSE_one_level_annotation
|  OPERATION_single_value_annotation
|  LABEL_single_value_annotation
|  EXISTENCE_CLASS_one_level_annotation
|  EXISTENCE_CONDITION_boolean_assignment
|  CHARACTERIZATION_CLASS_one_level_annotation
|  CHARACTERIZATION_CONDITION_boolean_assignment

ALF 2.0 Chapter 11.15

```
wire_item ::=
   all_purpose_item
```

```
|  SELECT_CLASS_one_level_annotation
|  node

node ::=
   NODE name_identifier { node_items }

node_items ::=
   node_item { node_item }

node_item ::=
   all_purpose_item
|  NODETYPE_single_value_annotation
|  NODE_CLASS_one_level_annotation
```

ALF 2.0 Chapter 11.16

```
arithmetic_models ::=
   arithmetic_model { arithmetic_model }

arithmetic_model ::=
   partial_arithmetic_model
|  full_arithmetic_model
```

Partial arithmetic model contains only definitions, no data. Can appear outside the semantically valid context of the model, as long as a semantically valid context exists within scope. (Example: semantically valid context of arithmetic model X is VECTOR, VECTOR exists within scope of LIBRARY, therefore partial arithmetic model X is legal within LIBRARY.) Definitions inside partial arithmetic model without *name*_identifier are inherited by each arithmetic model with *arithmetic_model*_identifier within scope. (Note: up to 2 levels of submodel are supported)

```
partial_arithmetic_model ::=
   arithmetic_model_identifier [ name_identifier ] {
      { all_purpose_item }
      { arithmetic_model_qualifier }
      { partial_arithmetic_submodel }
   }

partial_arithmetic_submodel ::=
   arithmetic_submodel_identifier [ name_identifier ] {
      { all_purpose_item }
      { partial_arithmetic_leaf_submodel }
   }

partial_arithmetic_leaf_submodel ::=
   arithmetic_submodel_identifier [ name_identifier ] {
      { all_purpose_item }
   }
```

Full arithmetic model contains both definitions and data. Can only appear in the semantically valid context of the model. Enables evaluation of arithmetic model in design context (e.g. delay calculation, power calculation). A trivial arithmetic model contains directly the evaluation value. A non-trivial arithmetic model requires calculation of the value, based on evaluation conditions. (Note: up to 2 levels of submodel are supported)

```
full_arithmetic_model ::=
   trivial_arithmetic_model
|  non_trivial_arithmetic_model

trivial_arithmetic_model ::=
   arithmetic_model_identifier [ name_identifier ] = value ;
|  arithmetic_model_identifier [ name_identifier ] = value {
      { all_purpose_item }
      { arithmetic_model_qualifier }
   }

non_trivial_arithmetic_model ::=
   arithmetic_model_identifier [ name_identifier ] {
      { all_purpose_item }
      { arithmetic_model_qualifier }
      arithmetic_model_body
      { arithmetic_model_datarange }
   }
|  arithmetic_model_identifier [ name_identifier ] {
      { all_purpose_item }
      [ violation ]
      { arithmetic_model_qualifier }
      full_arithmetic_submodels
   }

full_arithmetic_submodels ::=
   full_arithmetic_submodel { full_arithmetic_submodel }

full_arithmetic_submodel ::=
   full_arithmetic_leaf_submodel
|  arithmetic_submodel_identifier [ name_identifier ] {
      { all_purpose_item }
      full_arithmetic_leaf_submodels
   }

full_arithmetic_leaf_submodels ::=
   full_arithmetic_leaf_submodel { full_arithmetic_leaf_submodel }

full_arithmetic_leaf_submodel ::=
   trivial_arithmetic_leaf_submodel
|  non_trivial_arithmetic_leaf_submodel

trivial_arithmetic_leaf_submodel ::=
   arithmetic_submodel_identifier [ name_identifier ] = value ;
|  arithmetic_submodel_identifier [ name_identifier ] = value {
      { all_purpose_item }
   }

non_trivial_arithmetic_leaf_submodel ::=
   arithmetic_submodel_identifier [ name_identifier ] {
      { all_purpose_item }
      arithmetic_model_body
      { arithmetic_model_datarange }
   }
```

Auxiliary definitions for arithmetic model. Semantic restrictions apply. (Note: the new grammar allows non-ambiguous distinction between usage of MIN/TYP/MAX/ DEFAULT either as `arithmetic_leaf_submodel` or as `single_value_annotation`.)

```
arithmetic_model_qualifier ::=
   general_arithmetic_model_qualifier
|  connected_arithmetic_model_qualifier
|  analog_arithmetic_model_qualifier
|  timing_arithmetic_model_qualifier
|  layout_arithmetic_model_qualifier

general_arithmetic_model_qualifier ::=

|  VIA_single_value_annotation

arithmetic_model_datarange ::=
   MIN_single_value_annotation
|  TYP_single_value_annotation
|  MAX_single_value_annotation
|  DEFAULT_single_value_annotation

arithmetic_model_body ::=
   [ header ] table [ equation ]
|  [ header ] equation [ table ]

equation ::=
   EQUATION { arithmetic_expression }

from ::=
   FROM {
      [ PIN_single_value_annotation ]
```

```
      [ EDGE_NUMBER_single_value_annotation ]
      [ THRESHOLD_arithmetic_model ]
   }

to ::=
   TO {
      [ PIN_single_value_annotation ]
      [ EDGE_NUMBER_single_value_annotation ]
      [ THRESHOLD_arithmetic_model ]
   }
```

Auxiliary definitions for arithmetic model, also applicable elsewhere (separate chapter?).

VIOLATION is also applicable for ILLEGAL

```
violation ::=
   VIOLATION {
      [ MESSAGE_TYPE_single_value_annotation ]
      [ MESSAGE_single_value_annotation ]
      [ behavior ]
   }
```

TABLE and HEADER are also applicable for CONNECTIVITY.

```
table ::=
   TABLE { values }

header ::=
   HEADER { arithmetic_model_identifiers }
   HEADER { header_arithmetic_models }
```

Arithmetic model in context of HEADER (Note: no submodels allowed).

```
header_arithmetic_models ::=
   header_arithmetic_model { header_arithmetic_model }

header_arithmetic_model ::=
   arithmetic_model_identifier [ name_identifier ] {
      { all_purpose_item }
      { arithmetic_model_qualifier }
      { arithmetic_model_body }
      { arithmetic_model_datarange }
   }
```

Container of arithmetic model (Note: LIMIT is special).

```
arithmetic_model_containers ::=
   arithmetic_model_container { arithmetic_model_container }

arithmetic_model_container ::=
   limit
|  arithmetic_model_container_identifier { arithmetic_models }

limit ::=
   LIMIT { limit_arithmetic_models }
```

Arithmetic model in context of LIMIT (Note: must contain leaf submodels MIN and/or MAX).

```
limit_arithmetic_models ::=
   limit_arithmetic_model { limit_arithmetic_model }

limit_arithmetic_model ::=
   arithmetic_model_identifier [ name_identifier ] {
      { all_purpose_item }
      [ violation ]
      { arithmetic_model_qualifier }
      limit_arithmetic_submodels
   }

limit_arithmetic_submodels ::=
   limit_arithmetic_submodel { limit_arithmetic_submodel }

limit_arithmetic_submodel ::=
   limit_leaf_arithmetic_submodel
|  arithmetic_submodel_identifier [ name_identifier ]  {
      { all_purpose_item }
      [ violation ]
      limit_arithmetic_leaf_submodels
   }

limit_arithmetic_leaf_submodels ::=
   limit_arithmetic_leaf_submodel { limit_arithmetic_leaf_submodel }

limit_arithmetic_leaf_submodel ::=
   min_or_max = number ;
|  min_or_max {
      { all_purpose_item }
      [ violation ]
      [ arithmetic_model_body ]
   }

min_or_max ::=
   MIN
|  MAX
```

11.0 Creating a standard ALF header file

relation to ALF 2.0 3.2.4, 3.2.6, 3.2.8, 3.2.9, 11.x

relation to IEEE P1603 8.6, 8/7, 8.8, 8.9, new Annex (normative or not TBD)

History Proposal by Wolfgang, May 22
review pending as of July 10
supplementary proposal by Wolfgang Oct. 7
left open for review by ALF parser developpers

11.1 Motivation

The idea is to define pertinent features of ALF using the ALF language itself. Such a definition could be used as a standard “header” file for ALF. Eventually, certain extensions of the language could then be defined by changing the header file instead of changing the language. This can be used for pure documentation purpose as well as for development of self-adapting ALF parsers.

11.2 Proposal

Use the KEYWORD statement to define standard arithmetic models.

Use the `definition_for_arithmetic_model` construct to define legal statements in the context of arithmetic models.

Use the CLASS statement for shared definitions.

Example (just to show the idea):

```
KEYWORD PROCESS = arithmetic_model ;
KEYWORD SLEWRATE = arithmetic_model ;
KEYWORD CURRENT = arithmetic_model ;

PROCESS {
   TABLE { nom spsn spwn wpsn wpwn }
}
CLASS all_models {
   KEYWORD UNIT = single_value_annotation ;
}
CLASS timing_models {
   CLASS { all_models }
   UNIT = 1e-9 ;
   KEYWORD RISE = arithmetic_model ;
   KEYWORD FALL = arithmetic_model ;
}
CLASS analog_models {
   CLASS { all_models }
   KEYWORD MEASUREMENT = single_value_annotation ;
}
```

```
SLEWRATE {
   CLASS { timing_models }
}
CURRENT {
   CLASS { analog_models }
   UNIT = 1e-3 ;
}
```

It may be worthwhile to explore how far we can get in describing ALF features in this language.

11.3 Supplementary proposal

Current definition for `keyword_declaration` (see ALF 2.0, chapter 3.2.9):

```
keyword_declaration ::=
   KEYWORD context_sensitive_keyword = syntax_item_identifier ;
```

Introduce the following extension:

```
keyword_declaration ::=
   KEYWORD context_sensitive_keyword = syntax_item_identifier ;
|  KEYWORD context_sensitive_keyword = syntax_item_identifier {
      VALUE_TYPE = value_type_identifier ;
   }

value_type_identifier ::=
   number
|  positive_number
|  non_negative_number
|  integer
|  unsigned
|  bit_literal
|  quoted_string
|  identifier
```

Note: need to add which value_type is compatible with which syntax_item_identifier (see grammar definition).

12.0 Amended semantics of LIMIT

relation to ALF 2.0 7.5

relation to IEEE P1603 11.6.4

History Wolfgang, July 2, o.k. on July 10
refined and incorporated in this doc on July 19
reviewed, amended, accepted and closed October 9

12.1 Motivation

ALF 2.0 misses a specification on how a design tool should handle a LIMIT.

12.2 Proposal

Existing text:

A `LIMIT` container shall contain arithmetic models. The arithmetic models shall contain submodels identified by `MIN` and/or `MAX`.
Proposed modification:
A `LIMIT` container shall contain arithmetic models. The arithmetic models shall contain submodels. These submodels shall either be exclusively identified by `MIN` and/or `MAX` or contain other submodels which shall be exclusively identified by `MIN` and/or `MAX`.
Example:

```
LIMIT { SLEWRATE {
      PIN = my_pin ;
      MAX = 5.4;
}  }
```

Alternative example:

```
LIMIT { SLEWRATE {
      PIN = my_pin ;
      RISE { MAX = 6.3; }
      FALL { MAX = 5.4; }
}  }
```

Proposed addition:

The values specified within LIMIT shall be considered as design limits. That means, design tools must create a design in such ways that the limits are respected. If the calculated actual values are found to be equal to the specified limit values, they shall be considered within the design limits. The `MAX` shall specify an upper limit. The `MIN` value shall specify a lower limit. Therefore, if both `MIN` and `MAX` values are specified for the same quantity under the same operating conditions, the `MAX` value must be greater or equal to the `MIN` value.

13.0 Semantics of SUPPLYTYPE and SUPPLY_CLASS for multi-rail support

relation to ALF 2.0 6.4.11, 6.4.13

relation to IEEE P1603 9.3.4

History email discussion on reflector initiated by Sergei Sokolov
captured in minutes July 10
incorporated in this document by Wolfgang, July 19
reviewed Oct. 9, pending comments wrt VHDL-AMS

13.1 Motivation

Semantics of SUPPLYTYPE are missing in ALF 2.0. Semantics of SUPPLY_CLASS for support of multiple power/ground rails are not well-defined.

13.2 Proposal for SUPPLYTYPE semantics

Syntax and set of values for SUPPLYTYPE are already defined in ALF 2.0, chapter 6.4.11. Following table contains proposed semantics.

TABLE 1. SUPPLYTYPE annotation for PIN object

Annotation value	description
power (default)	The PIN is the interface between a CELL and a power supply device, designed to source or sink a significant part of the CURRENT affecting the POWER consumption of the CELL. The VOLTAGE measured at this PIN is with respect to ground.
ground	The PIN is the interface between a CELL and the environmental common ground. Therefore, the nominal VOLTAGE measured at this PIN is zero. However, spurious non-zero VOLTAGE may occur and LIMITs for such VOLTAGE may be specified. The PIN is designed to serve as return path for a significant part of the CURRENT affecting the POWER consumption of the CELL.
reference	The PIN is the interface between a CELL and a device which supplies either a well-defined VOLTAGE or a well-defined CURRENT without being a significant contributor to the POWER consumption of the CELL. From an electrical standpoint, a reference is similar to a signal. However, from an information-theoretical standpoint, a reference is similar to a supply, because it does not contain information.

Note: ALF 2.0, chapter 6.4.3 defines the semantic implication of DIRECTION on a PIN with PINTYPE= SUPPLY. If the DIRECTION is input, then the CELL must be connected to a supply device in order to operate. If the DIRECTION is output, then the CELL itself is the supply device.

Note: A CELL needs not have exactly one PIN with SUPPLYTYPE=power and another PIN with SUPPLYTYPE=ground. Passive devices (e.g. capacitor, resistor, diode) do not have any supply pins. Semi-passive devices (e.g. clamp cells) have only supply pins corresponding to the voltage level of the clamp. For example, a clamp cell to zero would have a pin with SUPPLYTYPE=ground and DIRECTION=input and a pin with SIGNALTYPE=TIE, POLARITY=low, and DIRECTION=output. Active devices have, at least, either one pin with SUPPLYTYPE=power and another pin with SUPPLYTYPE=ground or two pins with SUPPLYTYPE=power and different supply voltages, usually one positive and one negative. In general, a cell may have zero to multiple pins with SUPPLYTYPE=power or ground or reference.

13.3 Proposal for SUPPLY_CLASS semantics

Note: This section is proposed to supersede ALF 2.0, chapter 6.4.13.

The purpose of SUPPLY_CLASS is to define a relation between a power supply system and a circuit utilizing the power supply system. The power supply system herein is understood to be a set of nets (also called “rails”) capable to maintain a well-defined electrical potential with respect to each other.

The power supply system itself shall be declared using a CLASS statement for global use in the context of a LIBRARY or a SUBLIBRARY or for local use in the context of a CELL or a WIRE.

The characteristics of the power supply system shall be defined in the context of the objects which refer to the system using the SUPPLY_CLASS annotation. The value of the annotation shall be the name of the CLASS declaring the power supply system. Multi-value annotation shall be legal. Multi-value annotation shall indicate that the object can be used within either power supply system appearing in the set of values, but not necessarily within all of them at the same time.

The object, in the context of which the SUPPLY_CLASS annotation and the optional characteristics of the power supply system appear, shall be one of the following:

- A PIN within a CELL
- A NODE within a WIRE
- A CLASS for global usage within a LIBRARY or a SUBLIBRARY or for local usage within a CELL or a WIRE

The characteristics of the power supply system, i.e., the characteristics of each net within the power supply system, shall optionally include the following items:

- An arithmetic model for VOLTAGE, eventually containing arithmetic submodels for MIN, TYP, MAX, and/or DEFAULT. In the context of a PIN with SUPPLYTYPE=power or a NODE with NODETYPE=power, the arithmetic model shall specify the value of the supply voltage itself. In the context of a PIN with SUPPLY-

TYPE=ground or a NODE with NODETYPE=ground, the value of the supply voltage shall be presumed zero. In the context of another PIN or NODE, an arithmetic model for VOLTAGE may appear, but no relationship to supply voltage shall be implied.

- A LIMIT statement, containing an arithmetic model for VOLTAGE with arithmetic submodels for MIN and/or MAX. In the context of a PIN with any SUPPLYTYPE, including “ground”, this model shall specify the tolerable limit for spurious supply voltage change, which may occur due to resistive, capacitive or inductive noise. In the context of another PIN, a LIMIT for VOLTAGE may appear, but no relationship to supply voltage shall be implied.
- A SUPPLYTYPE may appear in the context of a CLASS for the purpose to be inherited by a PIN. Similarly, a NODETYPE may appear in the context of a CLASS for the purpose to be inherited by a NODE.

The CONNECT_CLASS annotation (see ALF 2.0, chapter 9.17) within a PIN shall be used to establish connectivity between terminals of a power supply net. The annotation value shall be the name of a CLASS. The PIN shall inherit the statements appearing in the context of that CLASS, including, but not restricted to, the SUPPLY_CLASS annotation, the arithmetic model for VOLTAGE, the LIMIT for VOLTAGE, and eventually the SUPPLYTYPE annotation.

The SUPPLY_CLASS annotation shall also be legal within an arithmetic model for ENERGY or POWER. It shall indicate, which power supply system provides the energy or power described by the arithmetic model.

Example:

```
LIBRARY my_library {
   CLASS io ;
   CLASS core ;
   CLASS Vdd_io { SUPPLY_CLASS=io; SUPPLYTYPE=power; VOLTAGE=2.5; }
   CLASS Vss_io { SUPPLY_CLASS=io; SUPPLYTYPE=ground; }
   CLASS Vdd_core { SUPPLY_CLASS=core; SUPPLYTYPE=power; VOLTAGE=1.8; }
   CLASS Vss_core { SUPPLY_CLASS=core; SUPPLYTYPE=ground; }
   CELL core2io_interface {
      PIN Vdd1 { PINTYPE=supply; CONNECT_CLASS=Vdd_io; }
      PIN Vdd2 { PINTYPE=supply; CONNECT_CLASS=Vdd_core; }
      PIN Vss1 { PINTYPE=supply; CONNECT_CLASS=Vss_io; }
      PIN Vss2 { PINTYPE=supply; CONNECT_CLASS=Vss_core; }
      PIN in  { PINTYPE=digital; DIRECTION=input; SUPPLY_CLASS=core; }
      PIN out { PINTYPE=digital; DIRECTION=output; SUPPLY_CLASS=io; }
      VECTOR (?! in -> ?! out) {
         ENERGY e1 = 15.8 { SUPPLY_CLASS=io; }
         ENERGY e2 = 3.42 { SUPPLY_CLASS=core; }
      }
   }
}
```

14.0 Amended semantics of RESTRICT_CLASS and SWAP_CLASS

relation to ALF 2.0 6.1.3, 6.1.4, 6.1.5, 6.1.6

relation to IEEE P1603 9.2.3

History extensive email discussion involving Kevin Grotjohn, Tim Ehrler, Sean Huang
proposal formulated by Wolfgang, July 31
to be reviewed Nov. 12

14.1 Motivation

The semantics of RESTRICT_CLASS and SWAP_CLASS, as described in ALF 2.0, do not fit the intended usage models.

14.2 Proposal for RESTRICT_CLASS

Note: This section is proposed to supersede ALF 2.0, chapter 6.1.4.

The purpose of the optional RESTRICT_CLASS annotation shall be to identify characteristics of a CELL which allow or disallow usage of the CELL for certain application tools. Single-value or multi-value annotation shall be legal.

If the usage of the CELL is allowed, the application tool may add, remove, or substitute instances of such a cell in the design. If the usage of the CELL is not allowed, the application tool may not add, remove, or substitute instances of such a cell in the design.

The condition for usage shall be specified to the application tool, at least conceptually, by a boolean function on a set of known RESTRICT_CLASS values. The application tool shall, at least conceptually, evaluate this boolean function for each CELL. The value of a particular variable in the boolean function shall be considered “true”, if the value appears in the RESTRICT_CLASS annotation of the CELL. Otherwise, the value shall be considered “false”. Usage of the CELL shall be allowed, if the boolean function evaluates true, otherwise the usage of the CELL shall be disallowed. In addition, the usage of a CELL shall be disallowed, if one or more RESTRICT_CLASS values of the CELL are unknown to the application tool.

Example:

RESTRICT_CLASS values known by the tool = (A, B, C, D, E)

Condition for usage = A and not B or C

RESTRICT_CLASS values of CELL X = (A, B)
Condition is false, therefore usage of CELL X is not allowed

RESTRICT_CLASS values of CELL Y = (A, C)
Condition is true, therefore usage of CELL Y is allowed

RESTRICT_CLASS values of CELL Z = (A, C, F)
Condition is true, but usage of CELL Z is not allowed due to unknown value F

Note: The ALF standard does not prescribe a particular implementation of usage condition support in the tool. It is not necessary for the tool to provide a completely programmable usage condition to comply with the ALF standard. The degree of sophistication for usage condition support may be driven by user requirements.

14.3 Semantics of predefined RESTRICT_CLASS values

Note: The following table is proposed to replace table 6-6 in ALF 2.0, which contains some circular definitions.

TABLE 2. RESTRICT_CLASS annotation for CELL object

Annotation value	description
synthesis	Cell is suitable for usage by a tool performing transformations from a behavioral RTL design representation to a structural gate-level design representation or between functionally equivalent structural gate-level design representations
scan	Cell is suitable for usage by a tool creating or modifying a structural design representation by inserting circuitry for testability enabling serial shift of data through storage elements
datapath	Cell is suitable for usage by a tool creating or modifying a structural implementation of a dataflow graph within a design
clock	Cell is suitable for usage by a tool creating or modifying circuitry for the distribution of synchronization signals (also called clock signals) within a design
layout	Cell is suitable for usage by a tool creating or modifying physical locations (placement) and physical interconnects (routes) of components within a design

The usage of RESTRICT_CLASS values other than these predefined values shall be legal. It shall not be implied that these predefined RESTRICT_CLASS values are automatically “known” by every application tool.

14.4 Proposal for SWAP_CLASS

Note: This section is proposed to supersede ALF 2.0, chapter 6.1.3, 6.1.5, 6.1.6.

The purpose of SWAP_CLASS shall be to identify sets of CELLS, wherein each CELL in the set can be substituted for each other by a particular application tool. Multi-value annotation shall be legal.

If the usage of two CELLs is authorized for a particular application tool according to RESTRICT_CLASS (see previous chapter) and the intersection of SWAP_CLASS values of the two CELLs is not empty, then the two CELLs shall be considered equivalent for the

particular application tool, and the application tool is free to substitute one cell for the other.

Any SWAP_CLASS value shall make reference to a declared CLASS within a LIBRARY or SUBLIBRARY.

The CLASS statement may contain a RESTRICT_CLASS statement. In this case, the set of RESTRICT_CLASS values shall be inherited by the CELL containing the SWAP_CLASS statement. If the intersection of SWAP_CLASS values of the two CELLs is not empty and the usage of two CELLs is authorized according to the inherited RESTRICT_CLASS values, then the two CELLs shall be considered equivalent for the particular application tool, and the application tool is free to substitute one cell for the other.

Example with RESTRICT_CLASS and SWAP_CLASS (from ALF 2.0, chapter 6.1.5):

```
CLASS foo;
CLASS bar;
CLASS whatever;
CLASS my_tool;
CELL cell1 {
   SWAP_CLASS { foo bar }
   RESTRICT_CLASS { synthesis datapath }
}
CELL cell2 {
   SWAP_CLASS { foo whatever }
   RESTRICT_CLASS { synthesis scan my_tool }
}
```

In order to swap cell1 and cell2, application tool must know all RESTRICT_CLASS values mentioned in this example. Usage condition may be (synthesis) or (datapath or my_tool) or (synthesis and datapath or scan and my_tool) etc.

[modify figure 6-1 from ALF 2.0: non-empty intersection applies only to SWAP_CLASS]

Example with SWAP_CLASS and inherited RESTRICT_CLASS (from ALF 2.0, chapter6.1.6):

```
CLASS all_nand2 { RESTRICT_CLASS { synthesis } }
CLASS all_high_power_nand2 { RESTRICT_CLASS { layout } }
CLASS all_low_power_nand2 { RESTRICT_CLASS { layout } }
CELL cell1 {
      SWAP_CLASS { all_nand2 all_low_power_nand2 }
}
CELL cell2 {
      SWAP_CLASS { all_nand2 all_high_power_nand2 }
}
CELL cell3 {
      SWAP_CLASS { all_low_power_nand2 }
}
```

```
CELL cell4 {
      SWAP_CLASS { all_high_power_nand2 }
}
```

A tool must know synthesis in order to utilize and swap cell1 and cell2. Another tool must know layout in order to utilize cell1, cell2, cell3, cell4 and swap cell1 with cell3 or cell2 with cell4. A tool that knows both synthesis and layout may utilize and swap all four cells.

[modify figure 6-1 from ALF 2.0: non-empty intersection applies only to SWAP_CLASS]

15.0 Miscellaneous Grammar enhancements

relation to ALF 2.0 3.2, 11.x

relation to IEEE P1603 6.x, Annex A

History initial draft Oct. 7 by Wolfgang
to be reviewed Nov. 12

15.1 Motivation

The grammar serves not only the purpose of defining syntax, but also terminology. A parser does not care what terminology is used in grammar. However, if the grammar is written in a meaningful and concise way for human understanding, the terminology introduced therein can be used throughout the document for semantic explanation purpose. Since human understanding is always subjective, it may take some iterations, before the most meaningful and concise terminology is found.

15.2 Boolean_value literal

Current definition of pin_value in IEEE P1603, chapter 7.2.3:

```
pin_value ::=
   pin_variable
|  bit_literal
|  based_literal
|  unsigned
```

Issue: pin_value is referred to in IEEE 1603 chapter 6.6.1, which defines lexical rules. However, pin_value is not a lexical token. The following change provides a remedy:

```
pin_value ::=
   pin_variable
|  boolean_value

boolean_value ::=
   bit_literal
|  based_literal
|  unsigned
```

Instead of referring to pin_value in 6.6.1, refer to boolean_value. All the items in boolean_value are lexical tokens.

15.3 PULL statement

In ALF 2.0, chapter 6.4.17, PULL is defined as annotation. Chapter A.15.7 suggests to provide VOLTAGE and RESISTANCE annotation inside PULL statement. This would make PULL technically a two_level_annotation. However, RESISTANCE and VOLT-

AGE are arithmetic models rather than annotations. Therefore, the grammar for the PULL statement should be reformulated as follows:

```
pull ::=
   PULL = pull_value_identifier ;
|  PULL = pull_value_identifier { pull_items }
|  pull_template_instantiation

pull_items ::= pull_item { pull_item }

pull_item ::=
   voltage_arithmetic_model
|  resistance_arithmetic_model
```

Since PULL is used inside PIN, redefine pin_item (IEEE 1603, chapter 9.3.1) as follows:

```
pin_item ::=
   all_purpose_item
|  range
|  port
|  pull
|  pin_instantiation
```

Note:

```
pull_value_identifier ::=
   up
|  down
|  both
|  none
```

The *pull_value*_identifier eventually requires specification of both pull-up and pull-down resistance and voltage. Arithmetic submodels HIGH and LOW can be used for that purpose.

Example:

```
RESISTANCE { UNIT = 1ohm; }
VOLTAGE { UNIT = 1volt; }
PIN my_pin {
   PULL = both {
      RESISTANCE { HIGH = 500; LOW = 1000; }
      VOLTAGE { HIGH = 5; LOW = -5; }
   }
}
```

This pin features a pull up resistance of 500 ohm to be connected to 5 volt and a pull down resistance of 1000 ohm to be connected to -5 volt.

15.4 Annotation container

The annotation_container statement (see ALF 2.0, chapter 11.7) has been omitted in the new formulation of the grammar. Technically, annotation_container can be inter-

preted as a special case of `two_level_annotation`, but it may be advantageous to re-introduce `annotation_container`, because `two_level_annotation` features a value, whereas `annotation_container` does not. This distinction makes the data model more precise.

```
annotation_container ::=
   one_level_annotation_container
|  two_level_annotation_container
|  multi_level_annotation_container

one_level_annotation_container ::=
   annotation_container_identifier { one_level_annotations }

two_level_annotation_container ::=
   annotation_container_identifier { two_level_annotations }

multi_level_annotation_container ::=
   annotation_container_identifier { multi_level_annotations }
```

To do: identify all statements in the grammar which are actually `annotation_container`.

16.0 Amended semantics of CONNECTIVITY

relation to ALF 2.0 9.15

relation to IEEE P1603 11.13.1

History initial draft by Wolfgang, Oct. 7
to be reviewed Nov. 12

16.1 Motivation

CONNECTIVITY has been formulated as arithmetic_model in ALF 1.1, but not in ALF 2.0. In ALF 2.0, CONNECTIVITY is an exceptional statement different from arithmetic_model, albeit it features HEADER and TABLE like an arithmetic_model. The advantage of re-formulating CONNECTIVITY as arithmetic_model is to get rid of the exception and to utilize CONNECTIVITY also as argument in arithmetic_model. For example, other arithmetic models, for example minimum spacing, antenna rule etc., may depend on CONNECTIVITY. Another proposed enhancement is to utilize CONNECTIVITY not only as a requirement for connections but also as actual connection.

16.2 Proposal

The CONNECTIVITY statement shall be an arithmetic_model with value_type bit_literal. It may contain the optional CONNECT_RULE annotation, which shall specify a requirement for connections (see ALF 2.0, chapter 9.15.2). Without the CONNECT_RULE annotation, the CONNECTIVITY statement shall specify actual connectivity. The value “1” shall specify existing connection, the value “0” shall specify non-existing connection.

Example:

The following example describes pins on POLY layer with and without connection to diffusion.

```
   PIN pin1 { // this pin has a POLY feature connected to NDIFF
      AREA A1 = 0.01 { LAYER=POLY; }
      CONNECTIVITY = 1 { BETWEEN { POLY NDIFF } }
   }
   PIN pin2 { // this pin has a POLY feature not connected to NDIFF
      AREA A1 = 0.01 { LAYER=POLY; }
      CONNECTIVITY = 0 { BETWEEN { POLY NDIFF } }
   }
```

The following example describes a spacing rule between wires on the same layer, dependent whether they are on the same net or not.

```
// min distance between two wires, depending whether same net or not
RULE min_distance {
   PATTERN p1 { SHAPE = line; LAYER = metal1; }
   PATTERN p2 { SHAPE = line; LAYER = metal1; }
```

```
   LIMIT {
      DISTANCE {
         BETWEEN { p1 p2 }
         MIN {
            HEADER { CONNECTIVITY { BETWEEN { p1 p2 } } }
            EQUATION { CONNECTIVITY ? 0.1 : 0.2 }
         }
      }
   }
}
```

16.3 Supplementary proposal for CONNECT_TYPE

The CONNECT_TYPE annotation within the CONNECTIVITY statement shall specify the nature of the connection.

```
connect_type_single_value_annotation ::=
   CONNECT_TYPE = connect_type_identifier ;

connect_type_identifier ::=
   electrical
|  physical
```

The value “electrical” shall indicate that the objects are subjected to electrical connection, i.e., a permanent direct current path does or does not exist between the objects. The value “physical” shall indicate that the objects do or do not share common physical boundaries with each other. The value “electrical” shall be the default.

Supplementary explanation: A driver pin and a receiver pin of a routed wire have CONNECT_TYPE electrical. A via cut and the adjacent metal segments have CONNECT_TYPE physical. CONNECT_TYPE physical does not always imply electrical connection. For example, objects of electrically insulating material may be physically connected to each other.

17.0 Amended semantics of PULSEWIDTH, PERIOD

relation to ALF 2.0 8.3.17, 8/3/18

relation to IEEE P1603 11.9.9, 11.9.10

History initial draft by Wolfgang, Oct. 7
to be reviewed Nov. 12

17.1 Motivation

PULSEWIDTH and PERIOD are introduced in ALF 1.1 and ALF 2.0 for the purpose of defining minimum pulse width and minimum period requirements in the context of a VECTOR. The keywords PULSEWIDTH and PEERIOD are used in the same way as SETUP, HOLD, RECOVERY, REMOVAL, which also define minimum timing requirements, without using the LIMIT or MIN statement. However, while SETUP, HOLD, RECOVERY, REMOVAL always represent minimum timing requirements, PULSEWIDTH and PERIOD could represent actual measurements or maximum requirements. Therefore we propose to amend the definitions of PULSEWIDTH and PERIOD to specify actual measurements.

17.2 Proposal

The keywords PULSEWIDTH and PERIOD shall specify arithmetic models in the context of a VECTOR.

PULSEWIDTH shall specify a measured time between two subsequent transitions on a pin, where the state of the pin after the second transition shall be equal to the state of the pin before the first transition. The PIN annotation shall be mandatory. The EDGE_NUMBER annotation shall be optional and specify the first transition of the two subsequent transitions. To specify a minimum or maximum constraint, use PULSEWIDTH in the context of LIMIT with submodel MIN or MAX, respectively.

PERIOD shall specify the measured time between two subsequent occurrences of the VECTOR. PIN annotation and EDGE_NUMBER annotation do not apply. To specify a minimum or maximum constraint, use PERIOD in the context of LIMIT with submodel MIN or MAX, respectively.

Example:

The following example specifies pulse width degradation through a buffer.

```
CELL my_buffer {
   PIN in { DIRECTION=input; }
   PIN out { DIRECTION=output }
   VECTOR ( 01 in -> 10 in <&> 01 out -> 10 out ) {
      // output pulse width = f(input pulse width)
      PULSEWIDTH { PIN = out;
```

```
         HEADER {
            PULSEWIDTH { PIN = in;
            TABLE { 0.1 0.2 0.3 0.4 0.5 }
         }
         // short pulses are shortened, long pulses keep their width
         TABLE { 0.05 0.18 0.29 0.4 0.5 }
      }
   }
}
```

The following example specifies cycle time (minimum period) and refresh time (maximum period) of a DRAM.

```
CELL my_DRAM {
   PIN CE { DIRECTION = input; SIGNALTYPE = enable; }
   // fill in other pins etc.
   VECTOR ( 01 ce ) {
      // for simplicity, presume that CE controls all operations
      LIMIT {
         PERIOD {
            MIN = 10;
            MAX = 100000;
         }
      }
   }
}
```

18.0 Amended definition of TIME and FREQUENCY statement in context of arithmetic model

relation to ALF 2.0 8.3.6, 8.9

relation to IEEE P1603 11.9.1

History initial draft by Wolfgang, Oct. 7
to be reviewed Nov. 12

18.1 Motivation

TIME and FREQUENCY are defined as arithmetic models. In addition, they are defined as annotations for arithmetic models featuring the MEASUREMENT annotation. The reason is the necessity to know either the time or the repetition frequency of a measurement. To get rid of the double-usage of the keywords, we propose to specify TIME and FREQUENCY as auxiliary “arithmetic model” within another arithmetic model rather than as “annotation”.

18.2 Proposal

TIME and FREQUENCY shall be usable as auxiliary arithmetic model within the context of another arithmetic model featuring the MEASUREMENT annotation with value “average”, “absolute_average”, “transient”, “RMS”, or “peak”. The evaluation of the auxiliary TIME or FREQUENCY models must be independent from the evaluation of the main model. Otherwise, TIME or FREQUENCY would have to appear within the HEADER of the main model.

In the context of a VECTOR, the auxiliary TIME model may feature a FROM or a TO statement. In the case of “peak”, this statement relates the occurrence time of the peak measurement to a transition appearing in the VECTOR (see ALF 2.0, chapter 8.9.3). In case of “average”, “absolute_average”, “transient”, “RMS”, the FROM and TO statement define the occurrence time of a transition appearing in the VECTOR as the start or end time, respectively, of the measurement.

Example:

The following example specifies multiple average power measurements within a single vector.

```
VECTOR ( 01 in -> 01 out ) {
   POWER p1 = 0.3 {
      MEASUREMENT = average;
      TIME { FROM { PIN = in; } TO { PIN = out; } }
   }
// average power is 0.3 measured between the transition at ″in″
// and the transition at ″out″
   POWER p2 = 0.4 {
```

```
      MEASUREMENT = average;
      TIME = 0.2 { FROM { PIN = out; } }
   }
// average power is 0.4 measured during 0.2 time units
// after transition at ″out″
}
```

The following example specifies time-window-sensitive noise margin.

```
VECTOR ( *? data -> 01 clock -> ?* data ) {
   NOISE_MARGIN = 0.45 {
      PIN = data;
      MEASUREMENT = transient;
      TIME {
         FROM { PIN=data; EDGE_NUMBER=0; }
         TO { PIN=data; EDGE_NUMBER=1; }
      }
   }
// pin ″data″ is noise-sensitive only around transition at pin ″clock″
   SETUP = 0.2 {
         FROM { PIN=data; EDGE_NUMBER=0; } TO { PIN=clock; }
   }
// sensitivity window starts 0.2 time units before ″clock″ transition
   HOLD = 0.3 {
         FROM { PIN=clock; } TO { PIN=data; EDGE_NUMBER=1; }
   }
// sensitivity window ends 0.3 time units after ″clock″ transition
}
```

19.0 Reference to models in other format than ALF

relation to ALF 2.0 3.2.3, 7, others?

relation to IEEE P1603 TBD

History proposed by Alex, Oct. 9
incorporated in this document by Wolfgang, Oct. 16

19.1 Motivation

VHDL and Verilog 2000 provide features to reference models written in other languages than VHDL and Verilog, respectively. The trend is multi-language support, and the capability to reference models, written for instance in C or C++ eliminates the need for translation and makes re-use of existing models more efficient.

19.2 Proposal

Note: This proposal would represent a major enhancement of ALF. It should be driven by the need and the feasibility of an implementation proving the concept. To get started, only rough ideas are given here.

The INCLUDE statement (see ALF 2.0, chapter 3.2.3) could be enhanced to specify the format of included files.

Example:

```
INCLUDE ”model1.vhd” { FORMAT = VHDL ; }
INCLUDE ”model2.v” { FORMAT = Verilog ; }
INCLUDE ”model3.c” { FORMAT = ”C++” ; }
INCLUDE ”model4.alf” { FORMAT = ALF ; } //default
```

The arithmetic_model statement (see ALF 2.0, chapter 7) could be enhanced to specify a reference to an external subroutine for evaluation of a model, instead of a TABLE or EQUATION. Such an external subroutine must be found in an included file. The arguments of the subroutine could be specified in the HEADER as long as they can be semantically interpreted as artihmetic_models. The complete set of arguments, including arguments which are alien to the ALF semantics, such as pointers to file handles etc., should be specified within the body of the subroutine statement.

Example:

```
DELAY Tdelay { FROM { PIN=X; } TO { PIN=Y; }
   HEADER {
      SLEWRATE Tslew { PIN=X; }
      CAPACITANCE Cload { PIN=Y; }
   }
   SUBROUTINE {
      Tdelay = double;
```

```
      c2 = double ;
      s1 = double ;
   }
}
```

Corresponding C code:

```
double Tdelay (Tslew, Cload)
double Tslew, Cload ;
{
   /* calculate return_value */
   return (return_value) ;
}
```

20.0 ROUTE annotation for PATTERN

relation to ALF 2.0 9.7

relation to IEEE P1603 9.9.3

History proposed by Wolfgang, Oct. 16

20.1 Motivation

Rules involving layout patterns may be anisotrop, i.e., depending on he routing direction. For example, the minimum distance between parallel lines on a given routing layer may depend on whether they are routed in horizontal or vertical direction (assuming that either tounting direction is allowed).

20.2 Proposal

The PATTERN statement shall have an optional ROUTE annotation with the legal values “horizontal” and “vertical”. In absence of the ROUTE annotation, the prefered routing direction (see PREFERENCE statement, ALF 2.0, chapter 9.5.4) shall be presumed.

Example:

```
RULE min_distance_horizontal {
   PATTERN p1 { LAYER=metal1; SHAPE=line; ROUTE=horizontal; }
   PATTERN p2 { LAYER=metal1; SHAPE=line; ROUTE=horizontal; }
   LIMIT { DISTANCE { BETWEEN { p1 p2 } MIN=0.5; } }
}
RULE min_distance_vertical {
   PATTERN p1 { LAYER=metal1; SHAPE=line; ROUTE=vertical; }
   PATTERN p2 { LAYER=metal1; SHAPE=line; ROUTE=vertical; }
   LIMIT { DISTANCE { BETWEEN { p1 p2 } MIN=0.4; } }
}
```

Note: Should we also include diagonal routes in order to support the new routing technology from Simplex?

21.0 REGION statement

relation to ALF 2.0 9

relation to IEEE P1603 9.9

History proposed by Wolfgang, Oct. 16

21.1 Motivation

The definition of abstract regions (as opposed to concrete layout patterns) has many applications: wire load models with obstructions, definition of transistors as intersection of poly and diffusion, scope of metal density check etc. Boolean operations on regions (and, or, exor) are also useful.

21.2 Proposal

The REGION statement shall be defined as follows:

```
region ::=
REGION region_identifier { region_items }

region_items ::= region_item { region_item }

region_item ::=
   all_purpose_item
   geometric_model
   geometric_transformation
   BOOLEAN_single_value_annotation

// all_purpose_item, geometric_model, geometric_transformation
// see existing grammar

BOOLEAN_single_value_annotation ::=
   BOOLEAN = boolean_expression ;
```

The operands *BOOLEAN*_single_value_annotation in the shall be *region*_identifiers of already defined regions or *pattern*_identifiers of already defined patterns or *layer*_identifiers of already defined layers.

The REGION statement shall be legal in the context of LIBRARY, SUBLIBRARY, CELL, WIRE, RULE, ANTENNA.

Example:

```
/* This antenna rule relates “gate” area, i.e. intersection of poly and
diffusion with total area of poly including routing */
ANTENNA for_poly {
   REGION gate { BOOLEAN = POLY && DIFF; }
   SIZE {
      HEADER {
```

```
         AREA Atotal { LAYER = poly; }
         AREA Agate { REGION = gate; }
      }
      EQUATION { Atotal / Agate }
   }
   LIMIT { SIZE { MAX = 100; } }
}

/* This rule defines local metal density in a 300um*300um region */
RULE local_metal_density {
   REGION local { WIDTH = 300; HEIGHT = 300; }
   LIMIT { DENSITY { REGION = local; MIN = 0.2; } }
}
```

22.0 WIRE instantiation within arithmetic model

relation to ALF 2.0 8.15

relation to IEEE P1603 9.4

History proposed by Wolfgang, Oct. 16

22.1 Motivation

Cells may be characterized with more complex load models than just a lumped capacitance, e.g. pi-model, lumped RLC, transmission line etc. Such complex load models can be described using the WIRE statement. However, there must be a statement connecting such models to a pin of a cell subjected to characterization.

22.2 Proposal

An arithmetic model describing electrical cell characterization data may contain a wire-instantiation statement defined as follows:

```
wire_instantiation ::=
   wire_identifier wire_instance_identifier { pin_assignments }
// pin_assignments see existing grammar
```

The *wire*_identifier shall be the name of an already defined WIRE. The *wire_instance*_identifier shall provide means to reference a named arithmetic model inside the WIRE using a hierarchical identifier. The pin_assignments shall define connectivity between a node within the WIRE (LHS) and a pin within the CELL (RHS).

22.3 Supplementary proposal

To enable referencing of the components of the WIRE by the HEADER of the arithmetic model, the COMPONENT annotation (see chapter 3.2 of this document) shall be used, in conjunction with an hierarchical identifier.

Example:

```
CELL my_cell {
   PIN in { DIRECTION=input; }
   PIN out { DIRECTION=output; }
   WIRE pi_model {
      NODE n1 { NODETYPE=driver; }
      NODE n2 { NODETYPE=receiver; }
      NODE n3 { NODETYPE=gnd; }
      CAPACITANCE C1 { NODE { n1 n3 } }
      CAPACITANCE C2 { NODE { n2 n3 } }
      RESISTANCE R1 { NODE { n1 n2 } }
   }
   DELAY {
```

```
      FROM { PIN=in; } TO { PIN=out; }
      pi_model load { n1 = out; }
      HEADER {
         CAPACITANCE C_near { COMPONENT = load.C1; TABLE { x x x } }
         CAPACITANCE C_far  { COMPONENT = load.C2; TABLE { x x x } }
         RESISTANCE { COMPONENT = load.R1; TABLE { x x } }
      }
      TABLE { x x x x x x x x x x x x x x x x x }
   }
}
```

23.0 Item
