# **IBIS-models today, their parameters and their accuracy**

**Eckhard Lenski      Siemens AG**

IBIS summit meeting DAC 2002

# Table of content

# Introduction

**ICN WN OP TDC TC 3    Modeling group**

Behavioral models since 1993

Model-sources

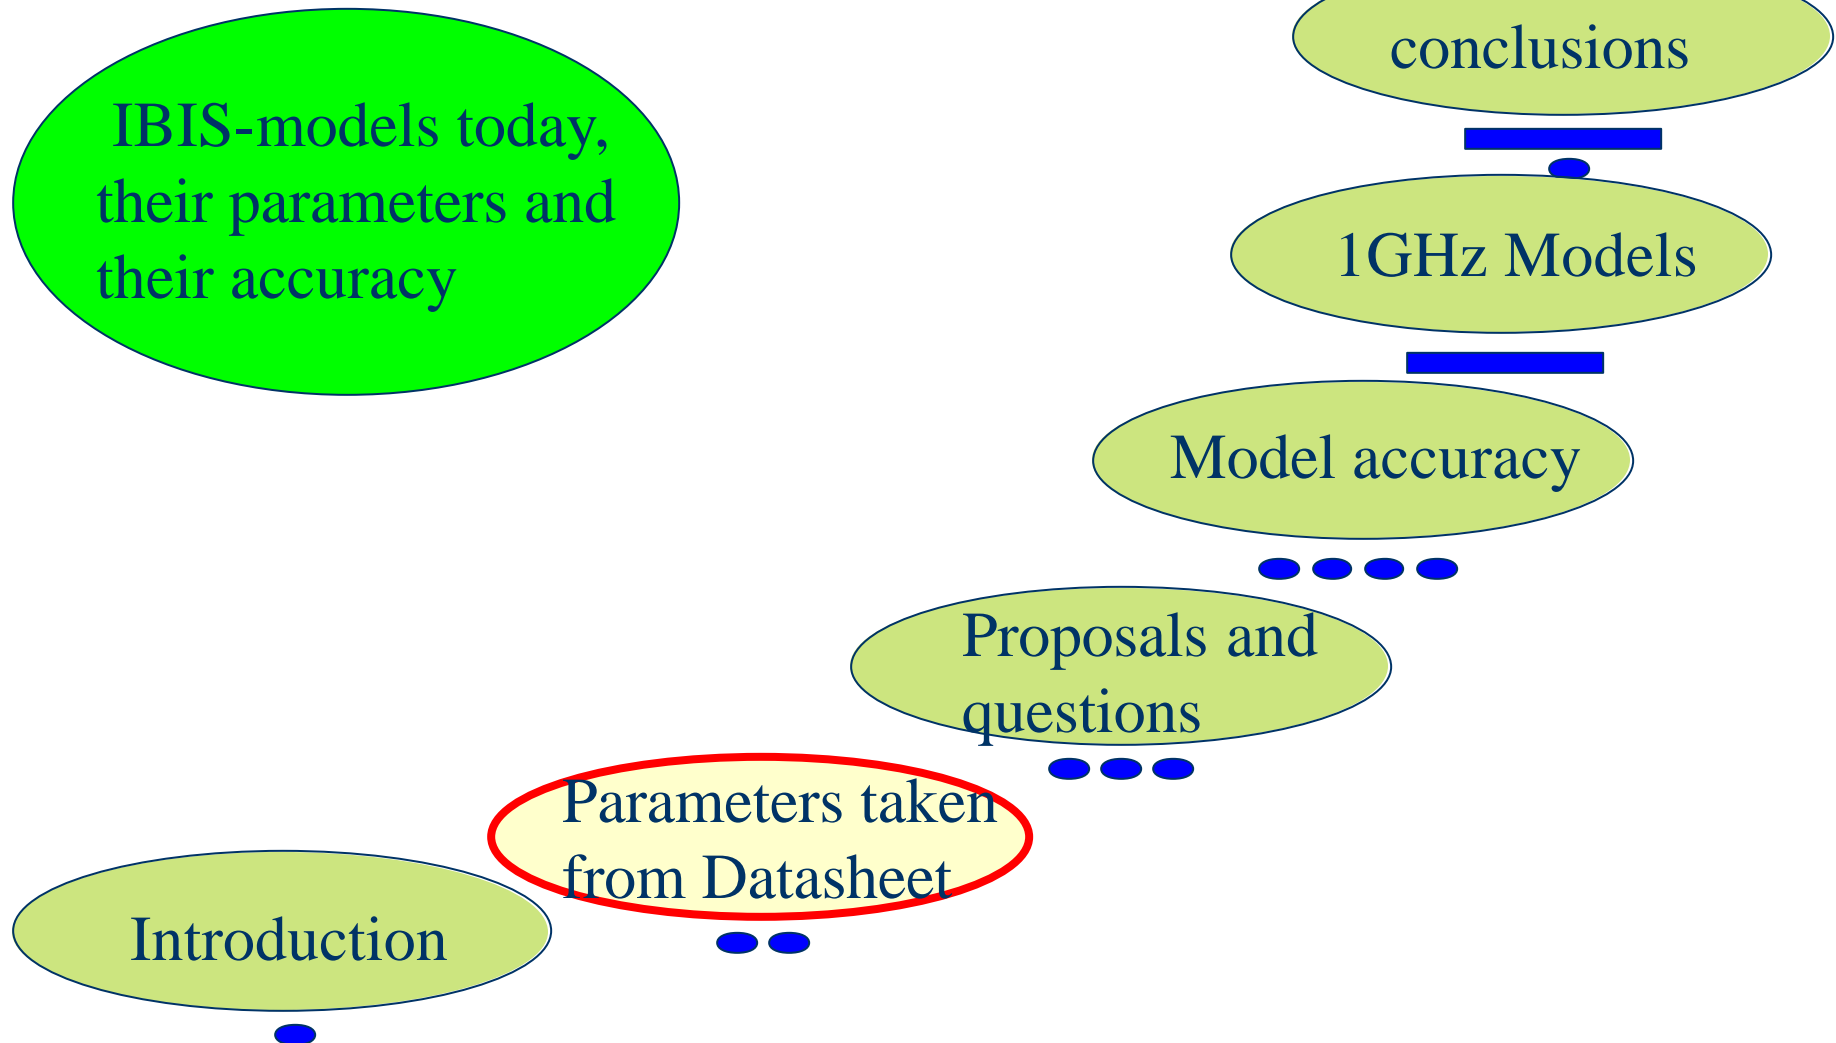

- measurements            1%
- HSPICE                    40%
- IBIS                        50%
- Databook                 9%

Library with more than 1500 models ( of IOs )

Models for new technologies            ( LVDS , CAN , PCML , ... )

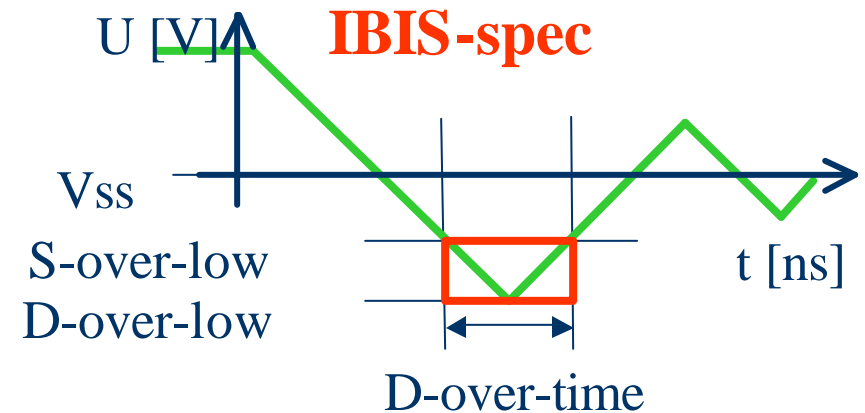

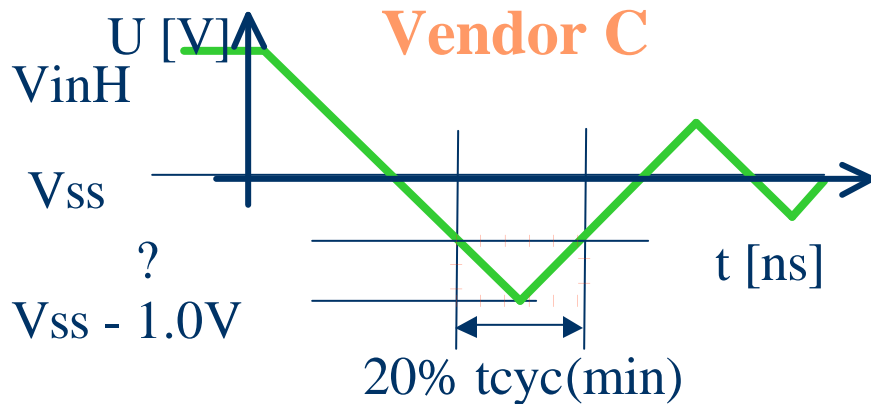

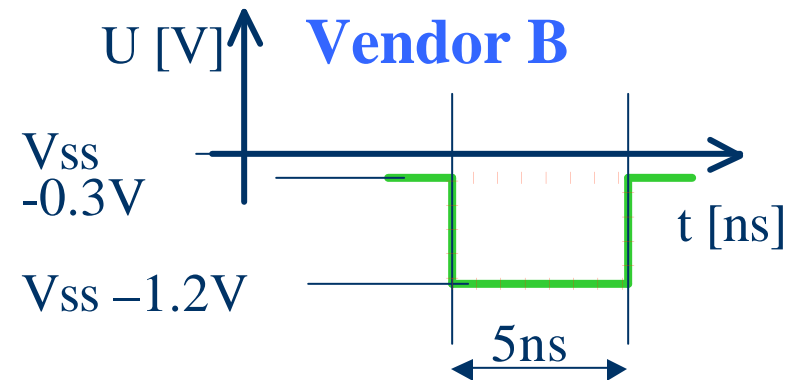

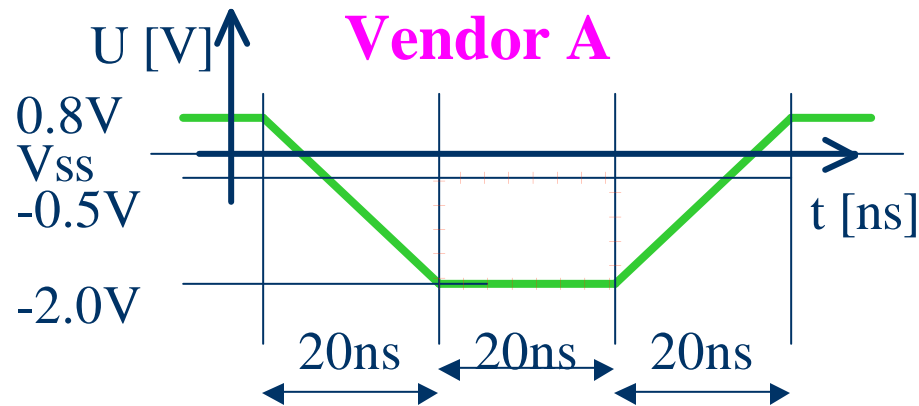

# Datasheet definitions

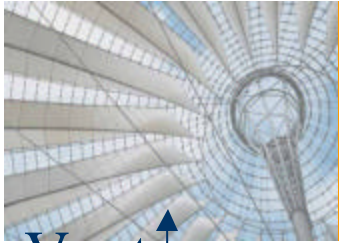

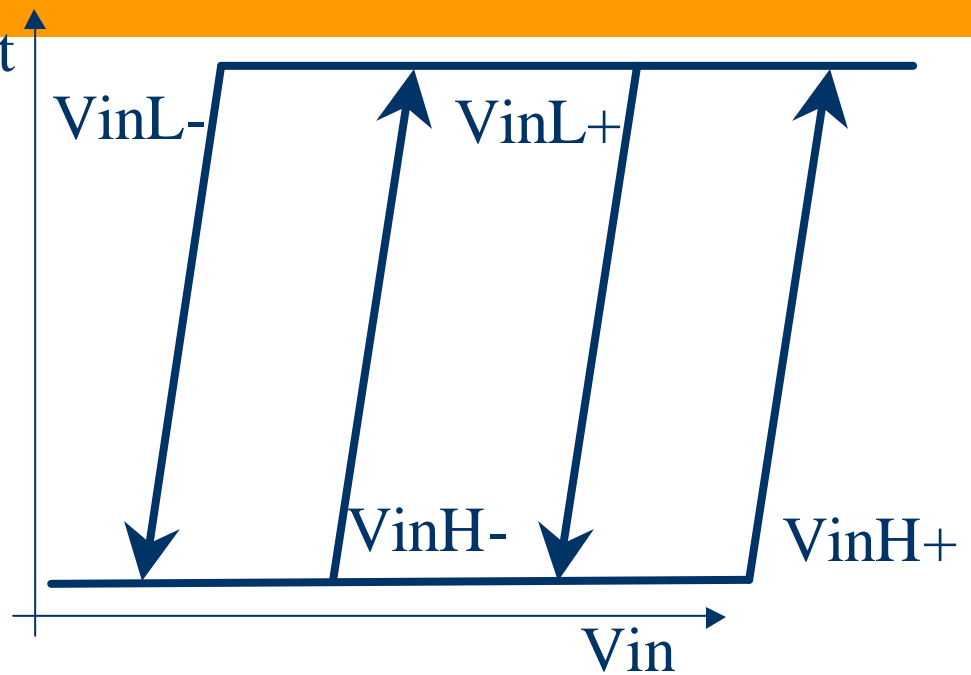

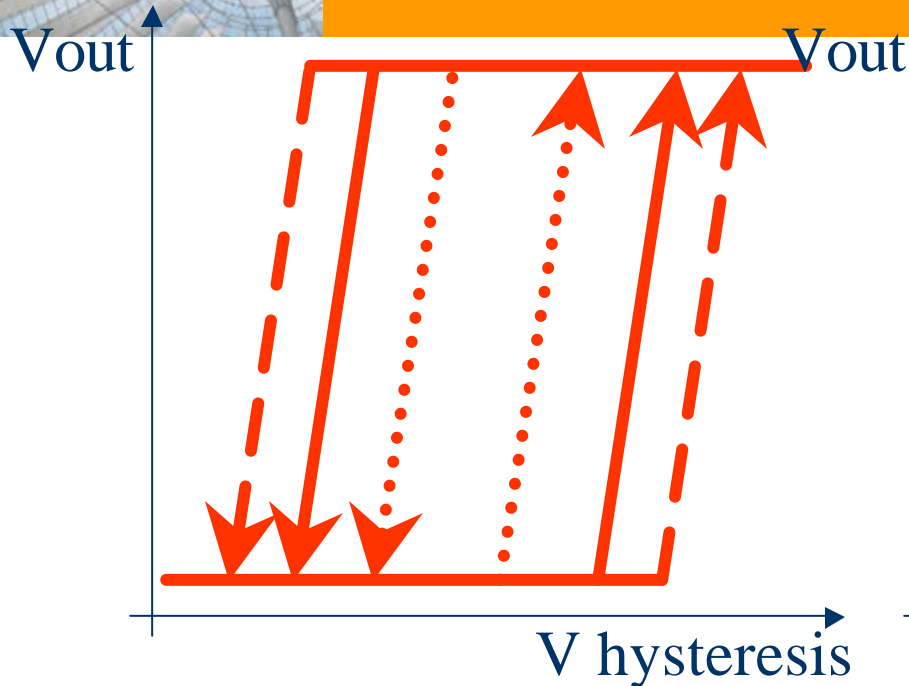

# Over-undershoot examples

Use dc. cond. for static-over and  
max. rat. for dynamic-over values

# Schmitt-Trigger

	Min		Max
Negative trigger voltage	0.8	1.25	1.7
Positiv trigger voltage	1.3	1.85	2.4
Hysteresis voltage	0.2	0.6	1.0

Use values of trigger voltages, don't use hysteresis

# Proposal and questions

IBIS-models today,  
their parameters and  
their accuracy

Introduction

Parameters taken  
from Datasheet

Proposals and  
questions

Model accuracy

E. Lenski

# Receiver with three ranges

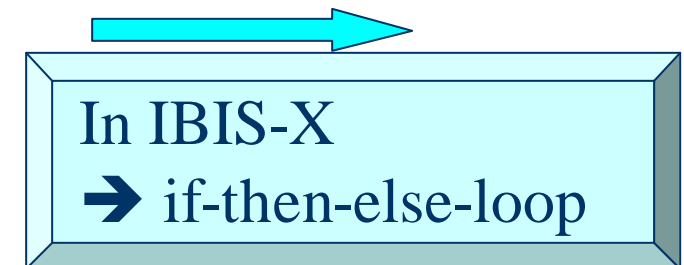

VinH	2.0V	Vcc+0.3
VinL	-0.3V	0.8V

Vin-range3	2.2V	Vcc + 0.3V
Vin-range2	1.0V	2.0V
Vin-range1	-0.3V	0.8V

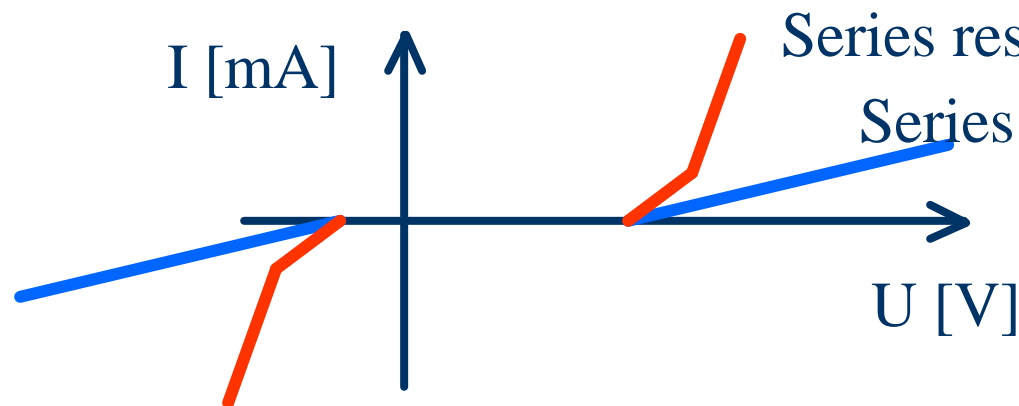

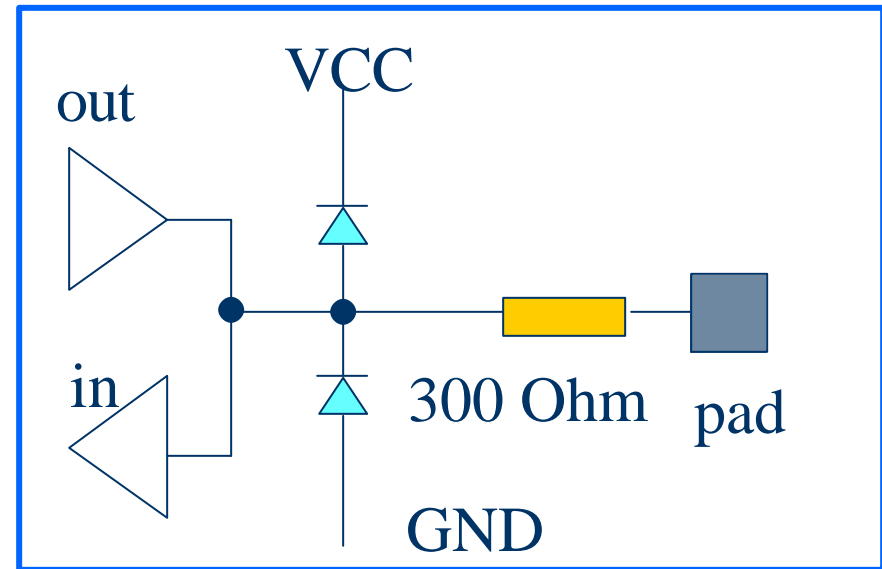

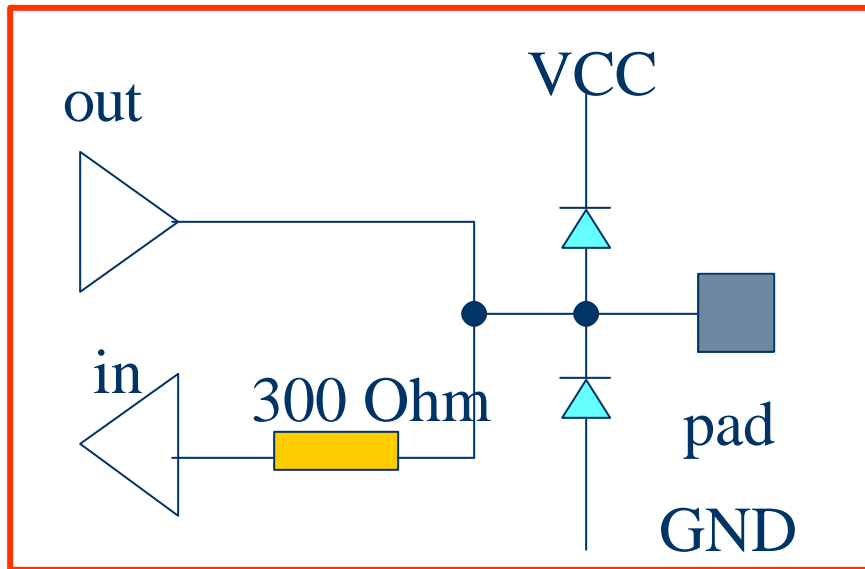

What to do ?

A	VinL-12	-0.3V	0.8V
	VinH-12	1.0V	2.0V
B	VinL-13	-0.3V	0.8V
	VinH-13	2.2V	Vcc + 0.3V
C	VinL-23	1.0V	2.0V
	VinH-23	2.2V	Vcc + 0.3V

# Input with series resistor

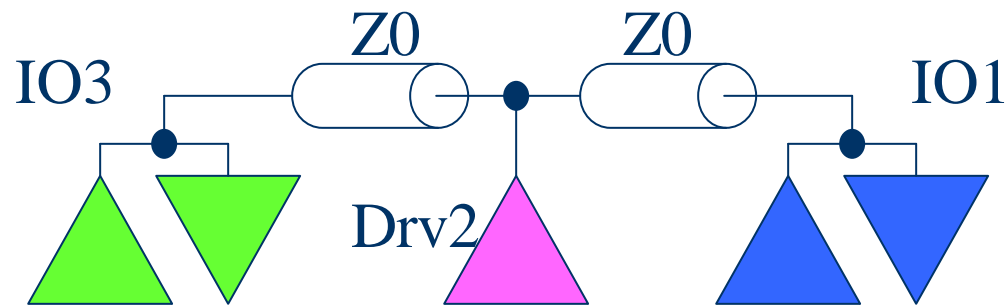

Series resistor not visible in clamp-curves  
Series resistor visible in clamp-curves

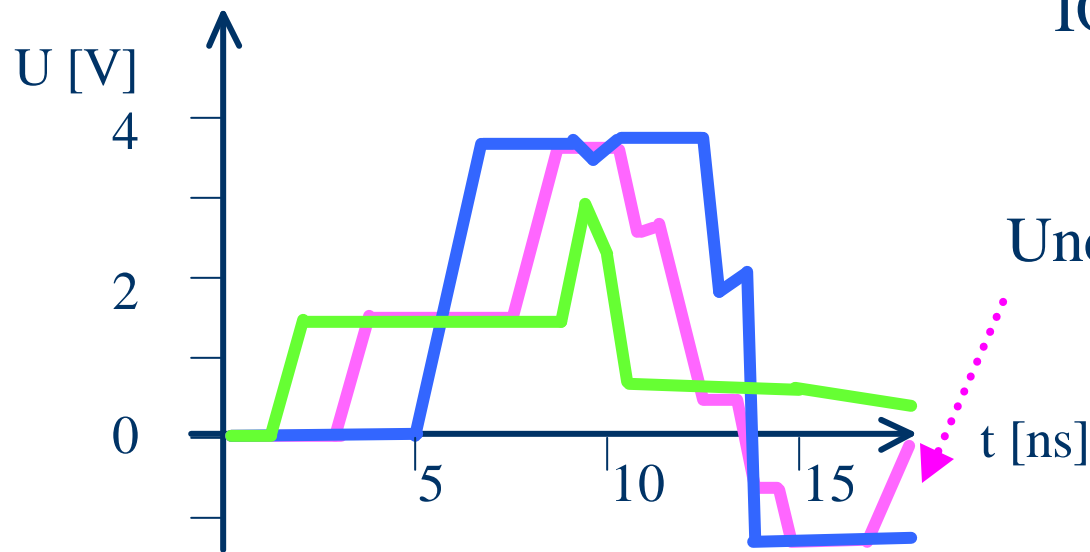

Put in package-model !?!  
Resistor needed at all ?

# Over-undershoot for driver

IO3 driving  
Drv2 3-state  
IO1 receiving

Undershoot at Drv2

Over-Undershoot parameter needed also for drivers

# What is an accurate model ?

IBIS-models today,  
their parameters and  
their accuracy

Introduction

Parameters taken  
from Datasheet

Proposals and  
questions

Model accuracy

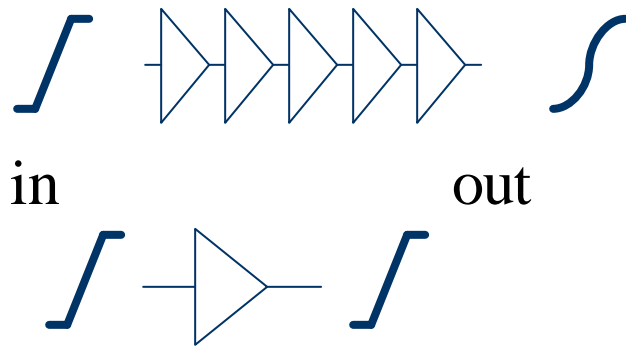

1GHz Models

conclusions

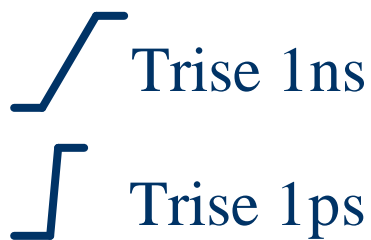

# Stimulus form, number of stages

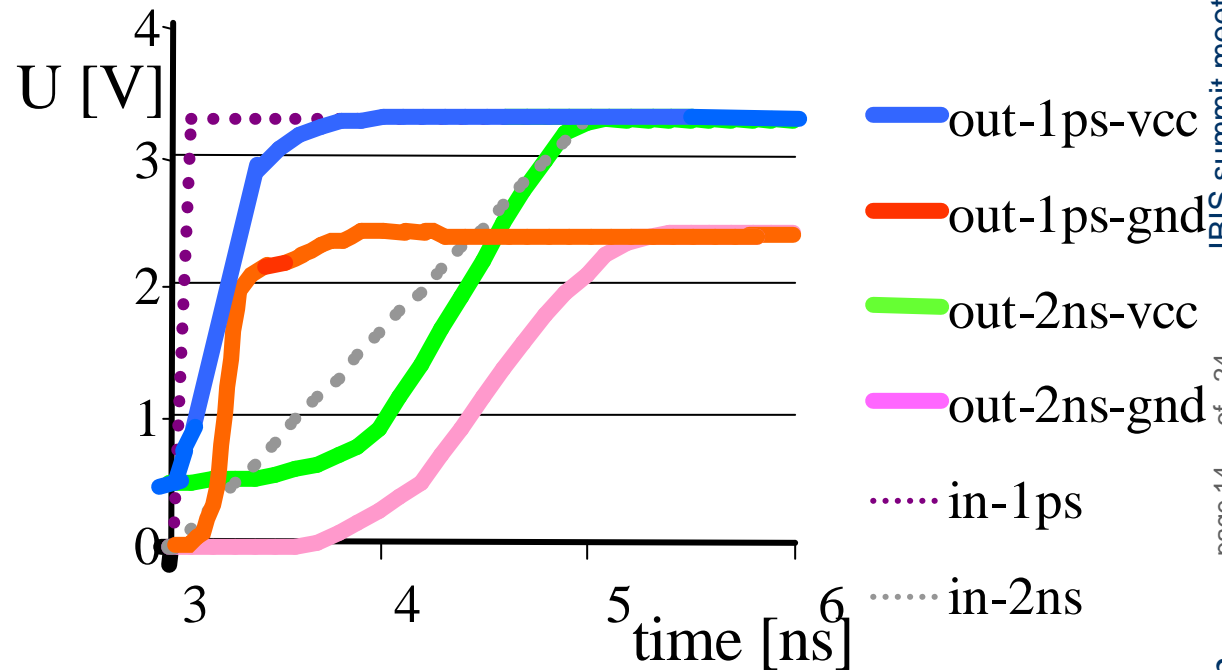

number of stages

Stimuli form

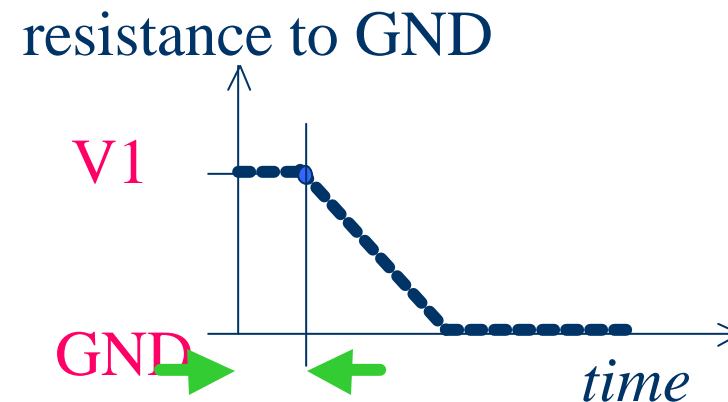

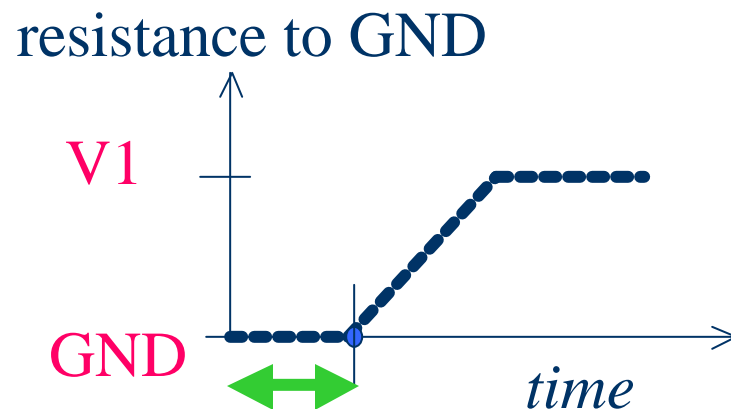

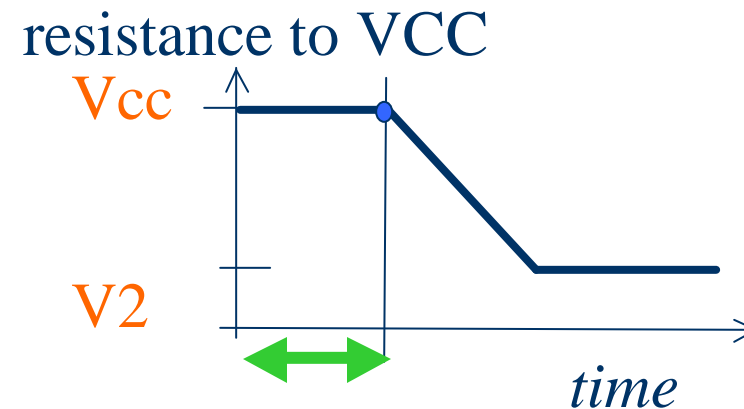

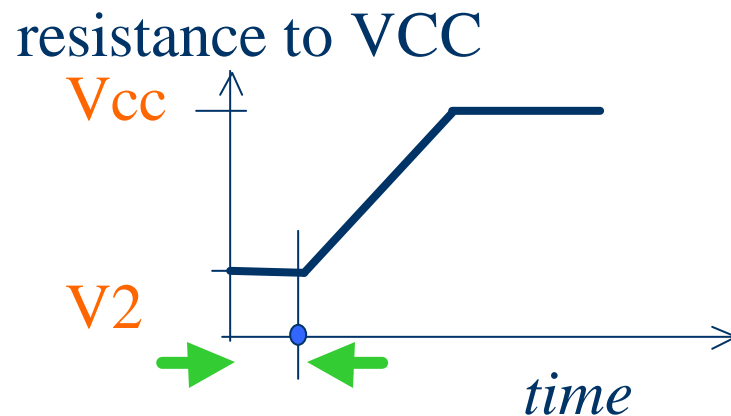

Use 5 or more stages and a stimulus of 1ps

# Starting points of waveform

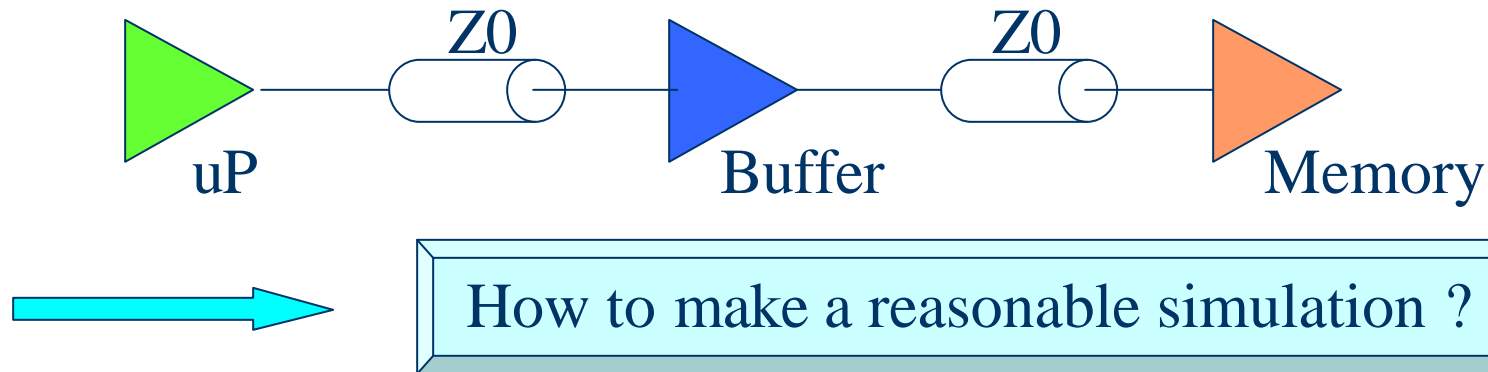

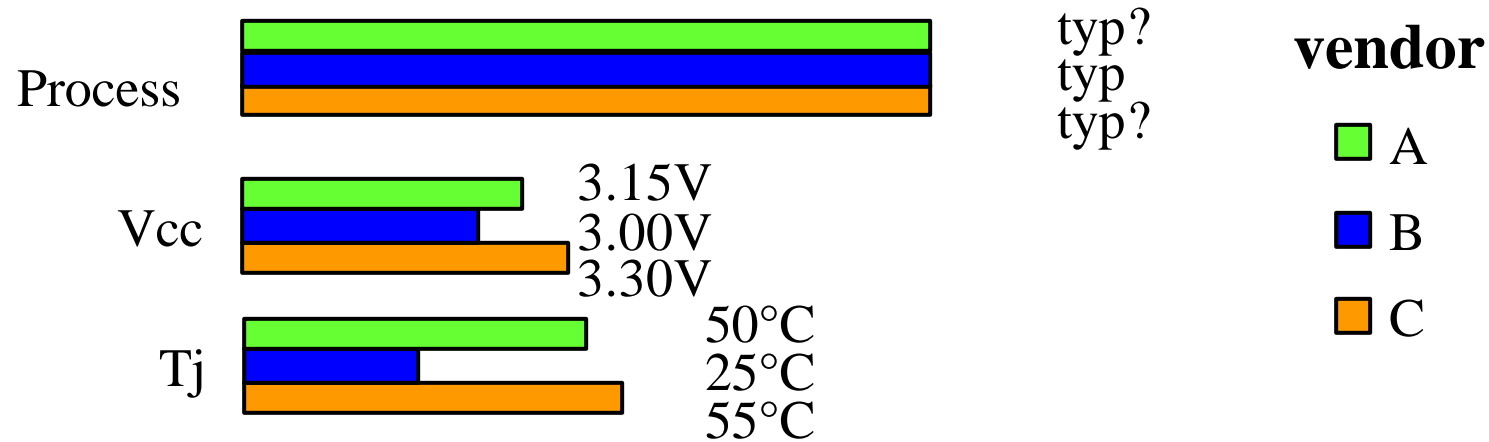

“Lead-in-time“ (described in ibis-4); how much is allowed ?

# Conditions for min-typ-max models

SIEMENS

Example : typical model parameters from 3 vendors

# Timestep for waveforms

[Ramp]  
 $dV/dt_r$  1.14V/0.30ns  
 $R_{load} = 50.00$

[Rising Waveform]  
 $R_{fixture} = 50.00$   
 $V_{fixture} = 0.000$

....  
0.40nS 1.58mV  
0.60nS -5.84mV  
0.80nS 0.0834V  
1.00nS 0.76V  
1.20nS 1.51V  
1.40nS 1.76V  
....

different timestep for simulation and printing

smaller value of  $dt_r$  or  $dt_f$

Timestep for printing should be

$dt_r$

10

( = 30ps )

# 1 GHz Models

conclusions

# Definition

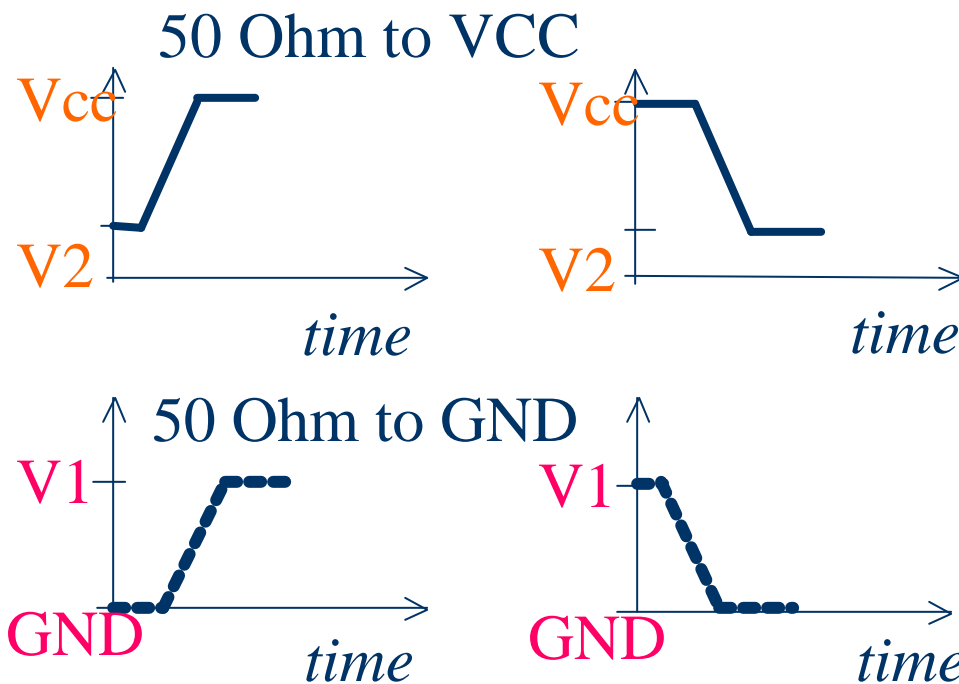

We have to separate in

- IO-Model
- Package model

# IO-model

SIEMENS

V-t-waveforms :

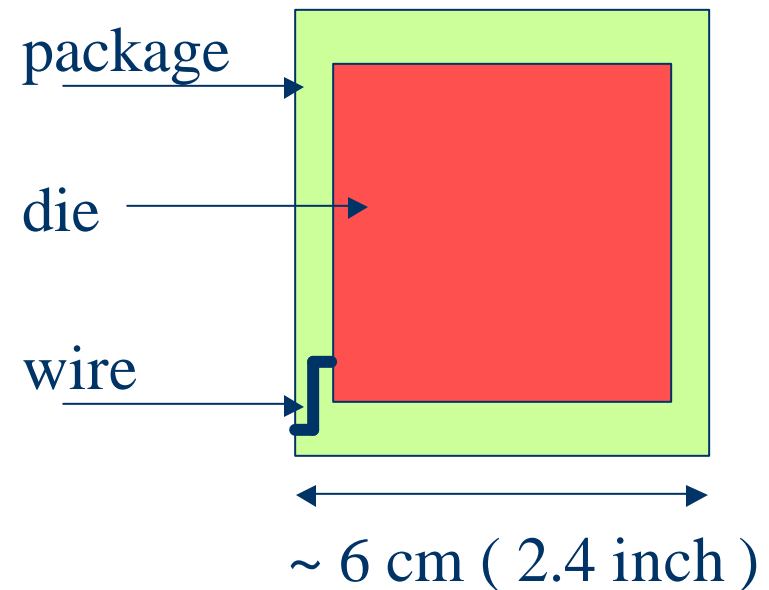

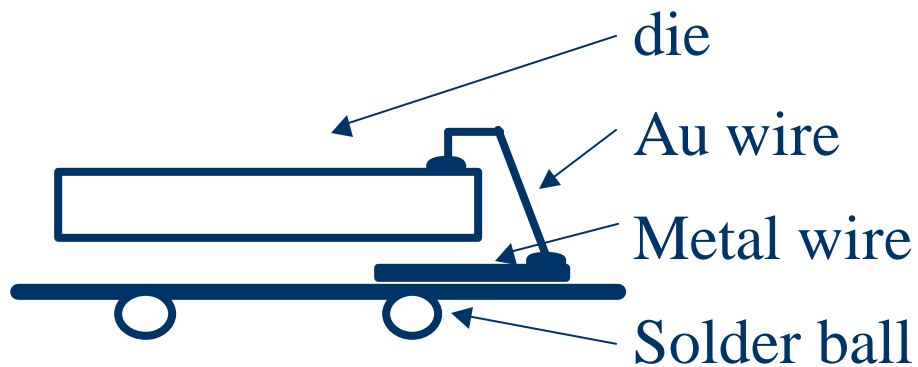

Look the same for  
1ns or 100ps

Models with rise-falltime of 250ps like LVDS, PECL and even CMOS show good results , but without package model

# Package model -1

## Schematic of BGA-Package

EPBGA with 1600 pins  
wire length up to 2.5 cm ( 1 inch )

## Package model -2

Correlation between package parameters and risetime

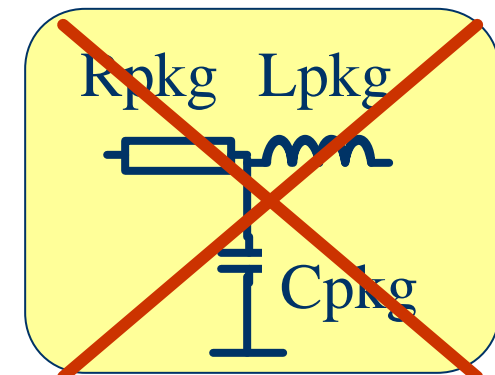

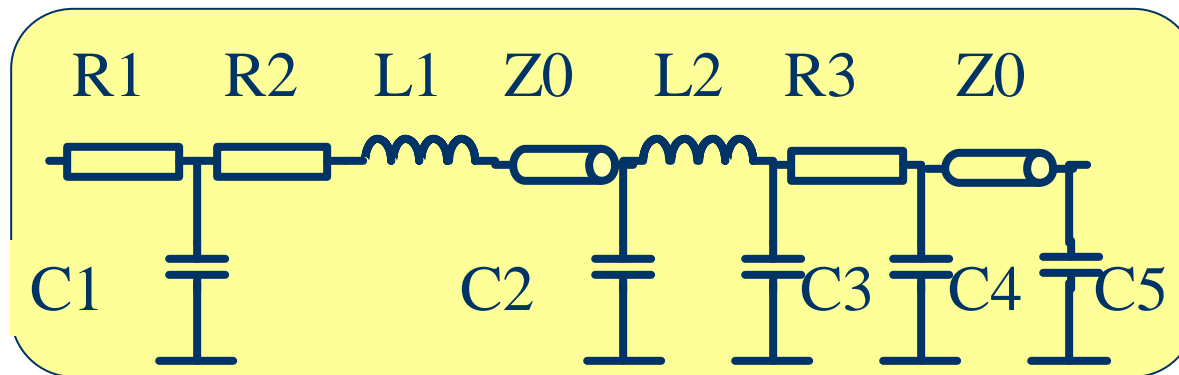

$$\text{Crit. Line delay} = T_r / 5$$

Risetime    Crit. Line length

Prop. Delay    5ns/m ( 1.52 ns/feet )

1 ns    4 cm ( 1.57 inch )

250 ps    1 cm ( 0.39 inch )

Packages used with model rise-falltimes < 250ps  
must be modeled as ( coupled ) transmission lines

Introduction

E. Lenski

Information and Communication Networks

IBIS-models today, their parameters and their accuracy.

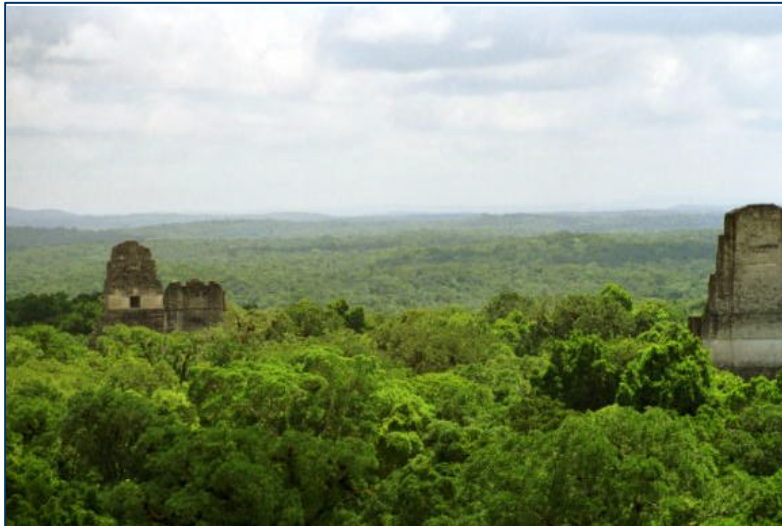

# Summary

- many missing parameters can be taken out of the datasheet
- IBIS-X and/or IBIS-4 could help
- clarify the conditions how to create a model
- IBIS models work well up to 1GHz

# It's getting clearer

SIEMENS
