

TPS71025 LOW-DROPOUT VOLTAGE REGULATOR

SLVS162A – MAY 1997 – REVISED MAY 1998

- **2.5-V Fixed-Output Regulator**
- **Very Low-Dropout (LDO) Voltage . . . 57 mV Typical at $I_O = 100$ mA**
- **Very Low Quiescent Current, Independent of Load . . . 292 μ A Typ**
- **Extremely Low Sleep-State Current, 0.5 μ A Max**
- **2% Tolerance Over Specified Conditions**
- **Output Current Range . . . 0 mA to 500 mA**
- **Available in Space Saving 8-Pin SOIC and 20-Pin TSSOP Packages**
- **0°C to 125°C Operating Junction Temperature Range**

description

The TPS71025 low-dropout regulator offers an order of magnitude reduction in both dropout voltage and quiescent current over conventional LDO performance. The improvement results from replacing the typical pnp pass transistor with a PMOS device.

Because the PMOS device behaves as a low-value resistor, the dropout voltage is very low (maximum of 95 mV at an output current of 100 mA) and is directly proportional to the output current (see Figure 1). Additionally, since the PMOS pass element is a voltage-driven device, the quiescent current is very low and remains independent of output loading (typically 292 μ A over the full range of output current, 0 mA to 500 mA). These two key specifications yield a significant improvement in operating life for battery-powered systems. The TPS71025 also features a sleep mode; applying a TTL high signal to \overline{EN} (enable) shuts down the regulator, reducing the quiescent current to 0.5 μ A maximum at $T_J = 25^\circ\text{C}$.

Figure 1. Dropout Voltage Versus Output Current

functional block diagram

Terminal Functions

NAME	TERMINAL NO.		DESCRIPTION
	NO.		
	D or P	PW	
$\overline{\text{EN}}$	2	6	Enable input. Logic low enables output
GND	1	1–3	Ground
IN	3, 4	8–10	Input supply voltage
OUT	5, 6	13, 14	Output voltage
SENSE	7	15	Output voltage sense input

TPS71025Y chip information

These chips, when properly assembled, display characteristics similar to those of the TPS71025. Thermal compression or ultrasonic bonding may be used on the doped aluminum bonding pads. The chips may be mounted with conductive epoxy or a gold-silicon preform.

THERMAL INFORMATION

In response to system-miniaturization trends, integrated circuits are being offered in low-profile and fine-pitch surface-mount packages. Implementation of many of today's high-performance devices in these packages requires special attention to power dissipation. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power-dissipation limits of a given component.

Three basic approaches for enhancing thermal performance are illustrated in this discussion:

- Improving the power-dissipation capability of the PWB design
- Improving the thermal coupling of the component to the PWB
- Introducing airflow in the system

Figure 16 is an example of a thermally enhanced PWB layout for the 20-lead TSSOP package. This layout involves adding copper on the PWB to conduct heat away from the device. The $R_{\theta JA}$ for this component/board system is illustrated in Figure 17. The family of curves illustrates the effect of increasing the size of the copper-heat-sink surface area. The PWB is a standard FR4 board ($L \times W \times H = 3.2 \text{ inch} \times 3.2 \text{ inch} \times 0.062 \text{ inch}$); the board traces and heat sink area are 1-oz (per square foot) copper.

Figure 16. Thermally Enhanced PWB Layout (Not to Scale) for the 20-Pin TSSOP

Figure 18 shows the thermal resistance for the same system with the addition of a thermally conductive compound between the body of the TSSOP package and the PWB copper routed directly beneath the device. The thermal conductivity for the compound used in this analysis is $0.815 \text{ W/m} \times ^\circ\text{C}$.

SLVS162A – MAY 1997 – REVISED MAY 1998

THERMAL INFORMATION

THERMAL RESISTANCE, JUNCTION-TO-AMBIENT
vs
AIR FLOW

Figure 17

THERMAL RESISTANCE, JUNCTION-TO-AMBIENT
vs
AIR FLOW

Figure 18

Using these figures to determine the system $R_{\theta JA}$ allows the maximum power-dissipation $P_{D(max)}$ limit to be calculated with the equation:

$$P_{D(max)} = \frac{T_{J(max)} - T_A}{R_{\theta JA(system)}}$$

Where

$T_{J(max)}$ is the maximum allowable junction temperature (i.e., 150°C absolute maximum or 125°C maximum recommended operating temperature for specified operation).

This limit should then be applied to the internal power dissipated by the TPS71025 regulator. The equation for calculating total internal power dissipation of the device is:

$$P_{D(total)} = (V_I - V_O) \times I_O + (V_I \times I_Q)$$

Because the quiescent current is very low, the second term is negligible, further simplifying the equation to:

$$P_{D(total)} = (V_I - V_O) \times I_O$$

THERMAL INFORMATION

For a 20-lead TSSOP/FR4 board system with thermally conductive compound between the board and the device body, where $T_A = 55^\circ\text{C}$, airflow = 100 ft/min, and copper heat sink area = 1 cm^2 , the maximum power-dissipation limit can be calculated. As indicated in Figure 18, the system $R_{\theta\text{JA}}$ is 94°C/W ; therefore, the maximum power-dissipation limit is:

$$P_{D(\text{max})} = \frac{T_{J(\text{max})} - T_A}{R_{\theta\text{JA}(\text{system})}} = \frac{125^\circ\text{C} - 55^\circ\text{C}}{94^\circ\text{C/W}} = 745\text{ mW}$$

If the system implements a TPS71025 regulator where $V_I = 3.3\text{ V}$ and $I_O = 385\text{ mA}$, the internal power dissipation is:

$$P_{D(\text{total})} = (V_I - V_O) \times I_O = (3.3 - 2.5) \times 0.385 = 308\text{ mW}$$

Comparing $P_{D(\text{total})}$ with $P_{D(\text{max})}$ reveals that the power dissipation in this example does not exceed the maximum limit. When it does, one of two corrective actions can be taken. The power-dissipation limit can be raised by increasing the airflow or the heat-sink area. Alternatively, the internal power dissipation of the regulator can be lowered by reducing the input voltage or the load current. In either case, the above calculations should be repeated with the new system parameters.

TPS71025 LOW-DROPOUT VOLTAGE REGULATOR

SLVS162A – MAY 1997 – REVISED MAY 1998

APPLICATION INFORMATION

† Capacitor selection is nontrivial. See external capacitor requirements section.

Figure 19. Typical Application Circuit

The TPS71025 low-dropout (LDO) regulator overcomes many of the shortcomings of earlier-generation LDOs, while adding features such as a power-saving shutdown mode.

device operation

The TPS71025, unlike many other LDOs, features very low quiescent current that remains virtually constant even with varying loads. Conventional LDO regulators use a pnp-pass element, the base current of which is directly proportional to the load current through the regulator ($I_B = I_C/\beta$). Examination of the data sheets reveals that those devices are typically specified under near no-load conditions; actual operating currents are much higher as evidenced by typical quiescent current versus load current curves. The TPS71025 uses a PMOS transistor to pass current; because the gate of the PMOS element is voltage driven, operating currents are low and stable over the full load range. The TPS71025 specifications reflect actual performance under load.

Another pitfall associated with the pnp-pass element is its tendency to saturate when the device goes into dropout. The resulting drop in β forces an increase in I_B to maintain the load. During power up, this translates to large start-up currents. Systems with limited supply current may fail to start up. In battery-powered systems, it means rapid battery discharge when the voltage decays below the minimum required for regulation. The TPS71025 quiescent current remains low even when the regulator drops out, eliminating both problems.

The TPS71025 also features a shutdown mode that places the output in the high-impedance state (essentially equal to the feedback-divider resistance) and reduces quiescent current to under 2 μA . If the shutdown feature is not used, $\overline{\text{EN}}$ should be tied to ground. Response to an enable transition is quick; regulated output voltage is reestablished in typically 120 μs .

minimum load requirements

The TPS71025 family is stable even at zero load; no minimum load is required for operation.

SENSE-pin connection

The SENSE pin must be connected to the regulator output for proper functioning of the regulator. Normally, this connection should be as short as possible; however, the connection can be made near a critical circuit (remote sense) to improve performance at that point. Internally, SENSE connects to a high-impedance wide-bandwidth amplifier through a resistor-divider network, and noise pickup feeds through to the regulator output. Routing the SENSE connection to minimize/avoid noise pickup is essential. Adding an RC network between SENSE and OUT to filter noise is not recommended because it can cause the regulator to oscillate.

APPLICATION INFORMATION

external capacitor requirements

An input capacitor is not required; however, a ceramic bypass capacitor (0.047 pF to 0.1 μ F) improves load transient response and noise rejection if the TPS71025 is located more than a few inches from the power supply. A higher-capacitance electrolytic capacitor may be necessary if large (hundreds of milliamps) load transients with fast rise times are anticipated.

As with most LDO regulators, the TPS71025 requires an output capacitor for stability. A low-ESR 10- μ F solid-tantalum capacitor connected from the regulator output to ground is sufficient to ensure stability over the full load range (see Figure 11). Adding high-frequency ceramic or film capacitors (such as power-supply bypass capacitors for digital or analog ICs) can cause the regulator to become unstable unless the ESR of the tantalum capacitor is less than 1.2 Ω over temperature. Capacitors with published ESR specifications such as the AVX TPSD106K035R0300 and the Sprague 593D106X0035D2W work well because the maximum ESR at 25°C is 300 m Ω (typically, the ESR in solid-tantalum capacitors increases by a factor of 2 or less when the temperature drops from 25°C to -40°C). Where component height and/or mounting area is a problem, physically smaller, 10- μ F devices can be screened for ESR. Figure 7 through Figure 14 show the stable regions of operation using different values of output capacitance with various values of ceramic load capacitance.

In applications with little or no high-frequency bypass capacitance (< 0.2 μ F), the output capacitance can be reduced to 4.7 μ F, provided ESR is maintained between 0.7 and 2.5 Ω . Because minimum capacitor ESR is seldom if ever specified, it may be necessary to add a 0.5- Ω to 1- Ω resistor in series with the capacitor and limit ESR to 1.5 Ω maximum. As shown in the ESR graphs (Figure 7 through Figure 14), minimum ESR is not a problem when using 10- μ F or larger output capacitors.

Below is a partial listing of surface-mount capacitors usable with the TPS71025. This information (along with the ESR graphs, Figure 7 through Figure 14) is included to assist in selection of suitable capacitance for the application. When necessary to achieve low height requirements along with high output current and/or high ceramic load capacitance, several higher ESR capacitors can be used in parallel to meet the guidelines above.

Load < 100 mA, ceramic load capacitance < 0.2 μF , full temperature range:

PART NO.	MFR.	VALUE	MAX ESR†	SIZE (H × L × W)†
195D106X06R3V2T	Sprague	10 μF , 6.3 V	1.5	1.3 × 3.5 × 2.7
195D106X0016X2T	Sprague	10 μF , 16 V	1.5	1.3 × 7 × 2.7
595D156X0016B2T	Sprague	15 μF , 16 V	1.8	1.6 × 3.8 × 2.6
695D226X0015F2T	Sprague	22 μF , 15 V	1.4	1.8 × 6.5 × 3.4
695D156X0020F2T	Sprague	15 μF , 20 V	1.5	1.8 × 6.5 × 3.4
695D106X0035G2T	Sprague	10 μF , 35 V	1.3	2.5 × 7.6 × 2.5

† Size is in mm. ESR is maximum resistance at 100 kHz and $T_A = 25^\circ\text{C}$. Listings are sorted by height.

POST OFFICE BOX 655303 • DALLAS, TEXAS 75265

TPS71025 LOW-DROPOUT VOLTAGE REGULATOR

SLVS162A – MAY 1997 – REVISED MAY 1998

MECHANICAL DATA

D (R-PDSO-G**)

PLASTIC SMALL-OUTLINE PACKAGE

14 PIN SHOWN

- NOTES: A. All linear dimensions are in inches (millimeters).
 B. This drawing is subject to change without notice.
 C. Body dimensions do not include mold flash or protrusion, not to exceed 0.006 (0,15).
 D. Falls within JEDEC MS-012

TPS71025 LOW-DROPOUT VOLTAGE REGULATOR

SLVS162A – MAY 1997 – REVISED MAY 1998

MECHANICAL DATA

P (R-PDIP-T8)

PLASTIC DUAL-IN-LINE PACKAGE

- NOTES: A. All linear dimensions are in inches (millimeters).
 B. This drawing is subject to change without notice.
 C. Falls within JEDEC MS-001

MECHANICAL DATA

PW (R-PDSO-G**)

PLASTIC SMALL-OUTLINE PACKAGE

14 PIN SHOWN

- NOTES: A. All linear dimensions are in millimeters.
 B. This drawing is subject to change without notice.
 C. Body dimensions do not include mold flash or protrusion not to exceed 0,15.
 D. Falls within JEDEC MO-153

PACKAGING INFORMATION

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
