

Final Assembly

- ▶ Your final project chip consists of a core and a pad ring
 - ▶ Core is the guts
 - ▶ Pad ring (or pad frame) connects the guts to the outside world
- ▶ It's critical to do a functional simulation of your whole chip, including the pads!
 - ▶ Make sure you can drive the chip from the external interface
 - ▶ Make sure you have the core connected to the pads correctly.

Chip Core

- ▶ The Chip Core is everything that is inside the Pad Ring
 - ▶ Try to floorplan your core so that it's as small a rectangle as possible
 - ▶ **At the very least, make sure it fits in the frame you've chosen**
 - ▶ Make sure to connect vdd and gnd in the core!
 - ▶ This core can be DRC and LVS checked
 - ▶ This core can be simulated for functionality
 - ▶ This core is then routed to the pads

Core Sizes

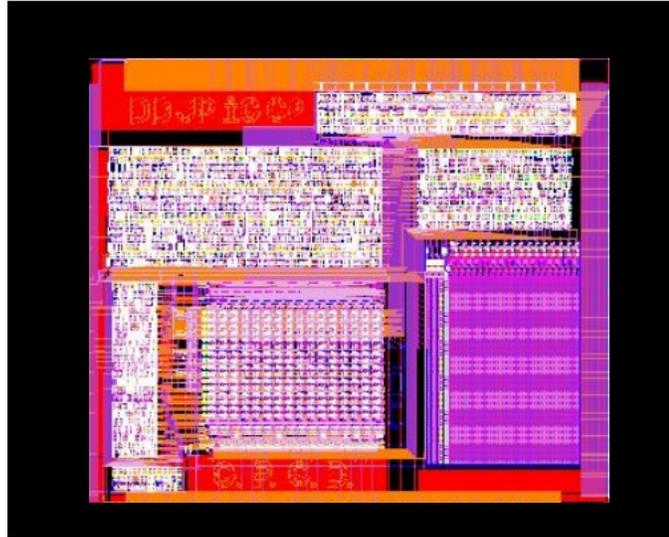

- ▶ All things are in terms of Tiny Chip Units (TCUs)
 - ▶ 1 TCU = 1.5x1.5mm outside dimension
 - ▶ 1 TCU = 900x900 usable core area
 - ▶ 2 TCU = 900x2300 usable core area
 - ▶ 4 TCU = 2300x2300 usable core area
- ▶ More on this later!

Connecting Core to Pads

- ▶ Once your core is complete, you need to connect it to the pad frame
 - ▶ Then you re-do the functional simulation, but through the pads this time
 - ▶ You should be able to re-use your testfixture
 - ▶ Also a final DRC and LVS which includes the pads
- ▶ Use **ccar** for connecting the core to the pads!

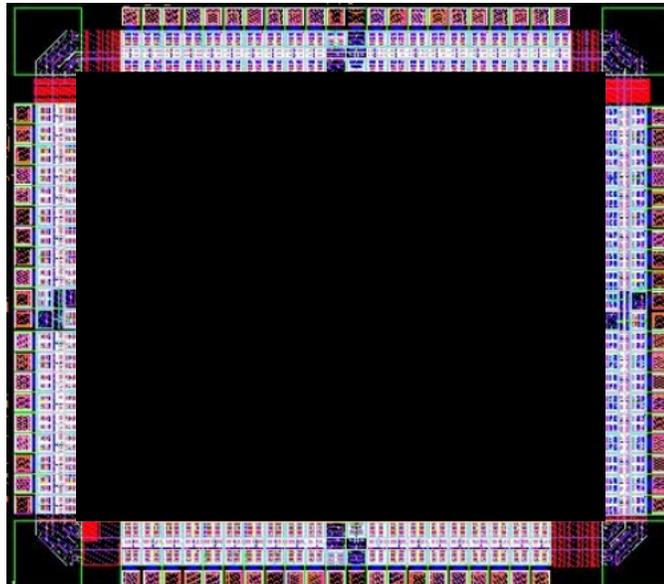

Core

- ▶ The guts of your chip

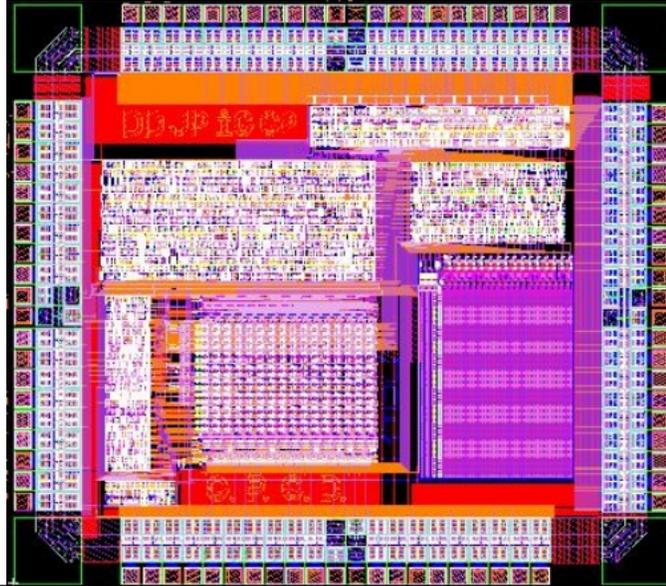

Pad Ring

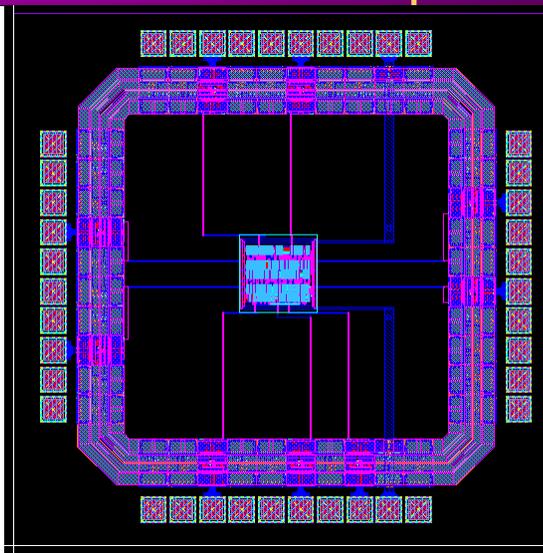

- ▶ The connection to the outside world

The Connected Chip

Tutorial Example

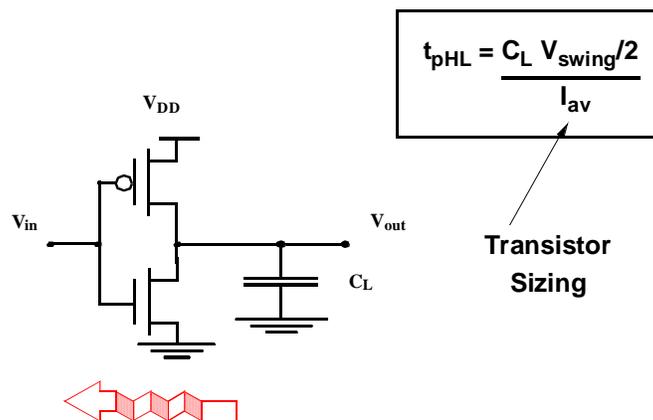

▶ A tiny state machine in a 1-tiny-chip frame

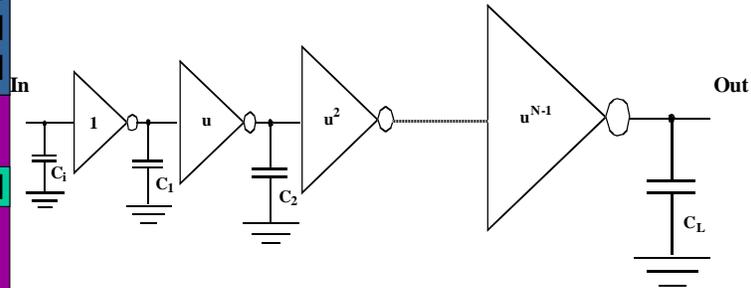

Pad Cells

- ▶ Started with a set of pads from MOSIS
 - ▶ Originally from Tanner Tools pads
 - ▶ Problem: the pads don't DRC, LVS, or simulate!
- ▶ Cameron Charles from Reid's group re-did the cells in 2002 to fix these issues
- ▶ Result is **UofU_Pads**
 - ▶ `/uusoc/facility/cad_common/local/Cadence/lib/UofU_Pads`
 - ▶ Use library manager to add this library
 - ▶ Name it UofU_Pads
 - ▶ They now DRC, LVS, and simulate!

Driving Large Capacitances

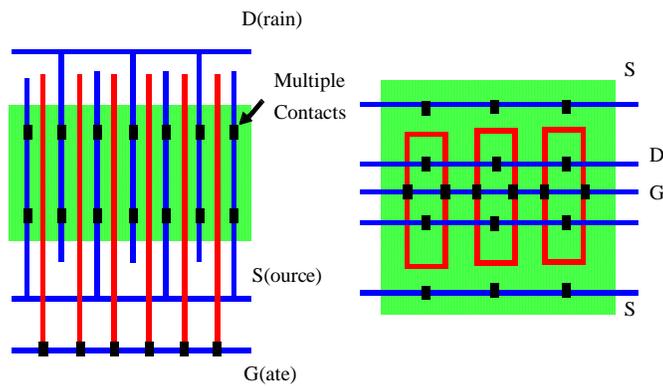

Using Cascaded Buffers

$$u_{\text{opt}} = e ?$$

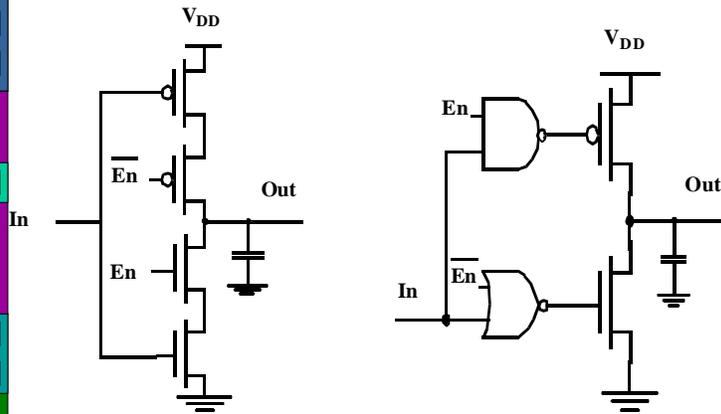

How to Design Large Transistors

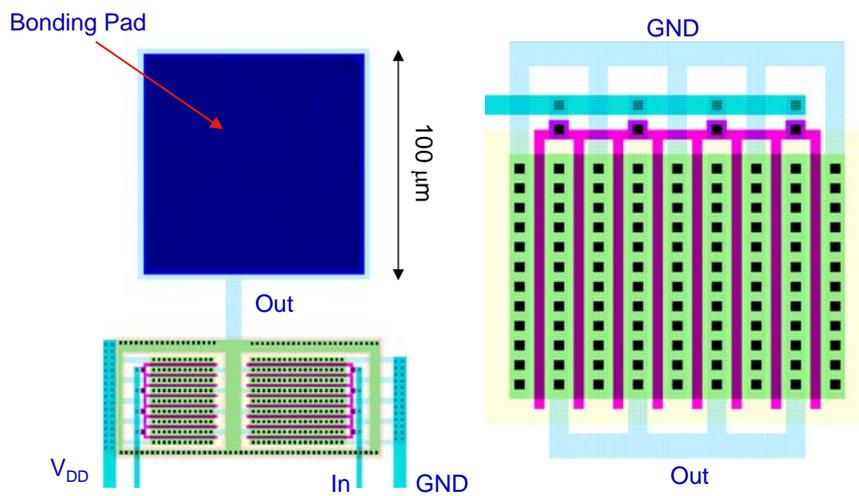

(a) small transistors in parallel

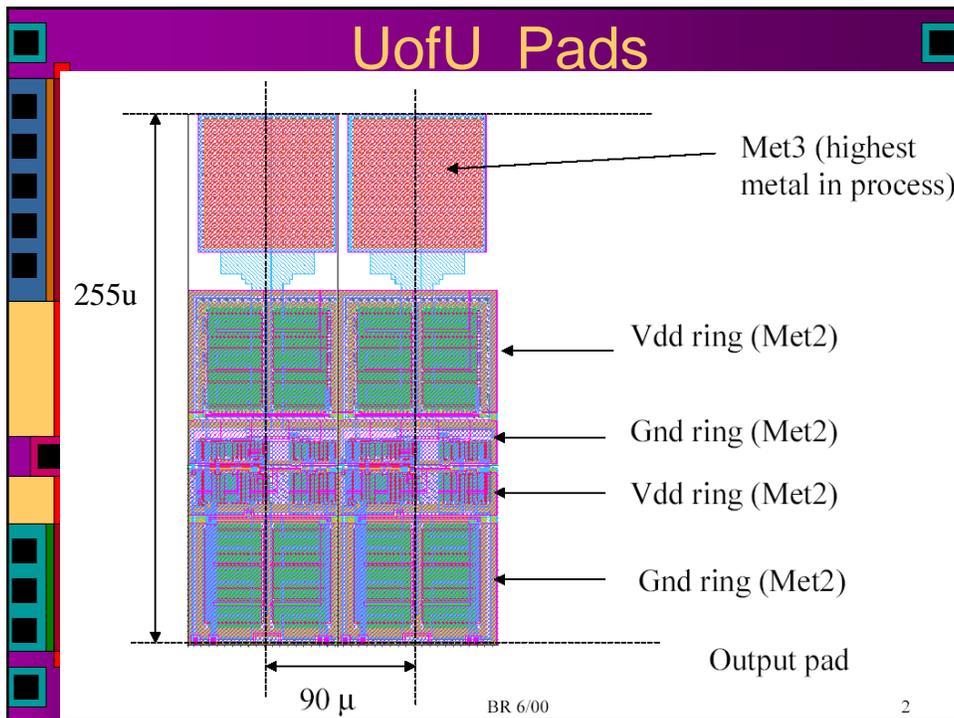

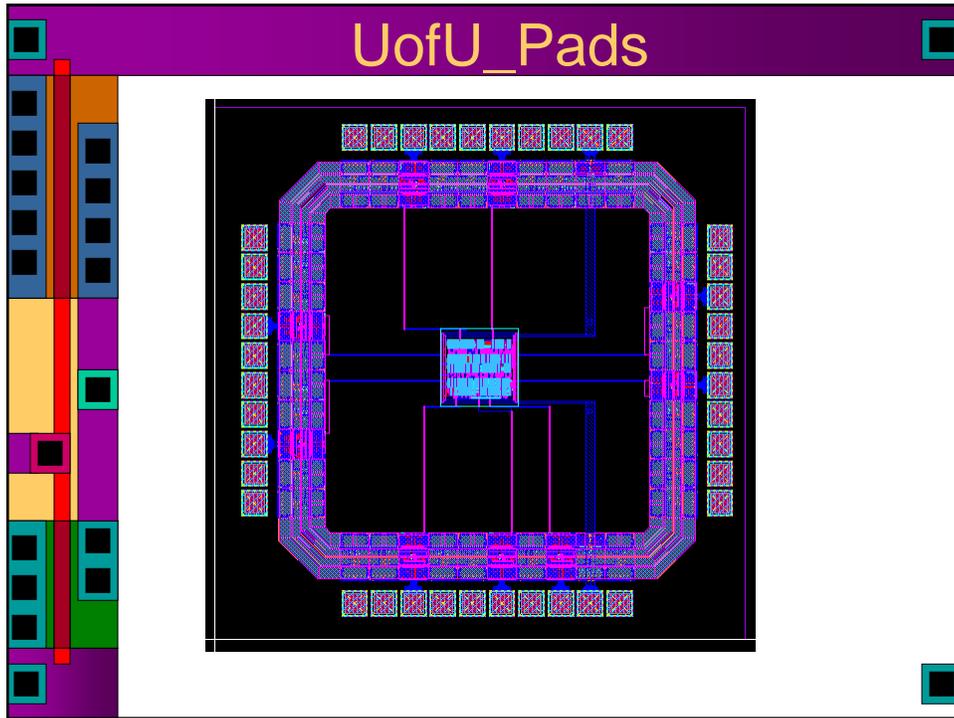

(b) circular transistors

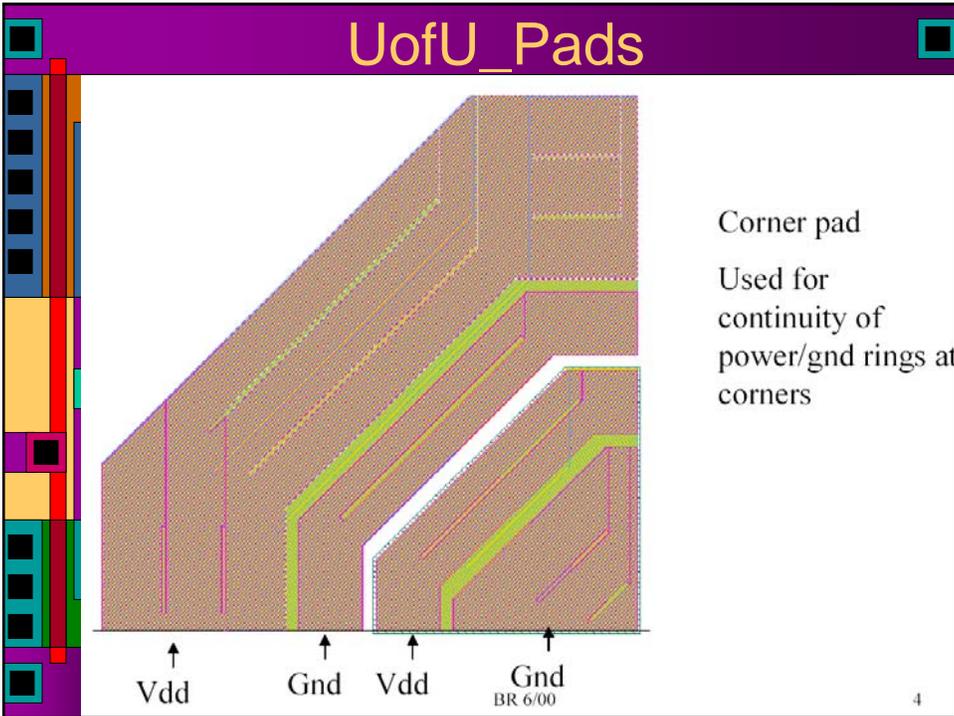

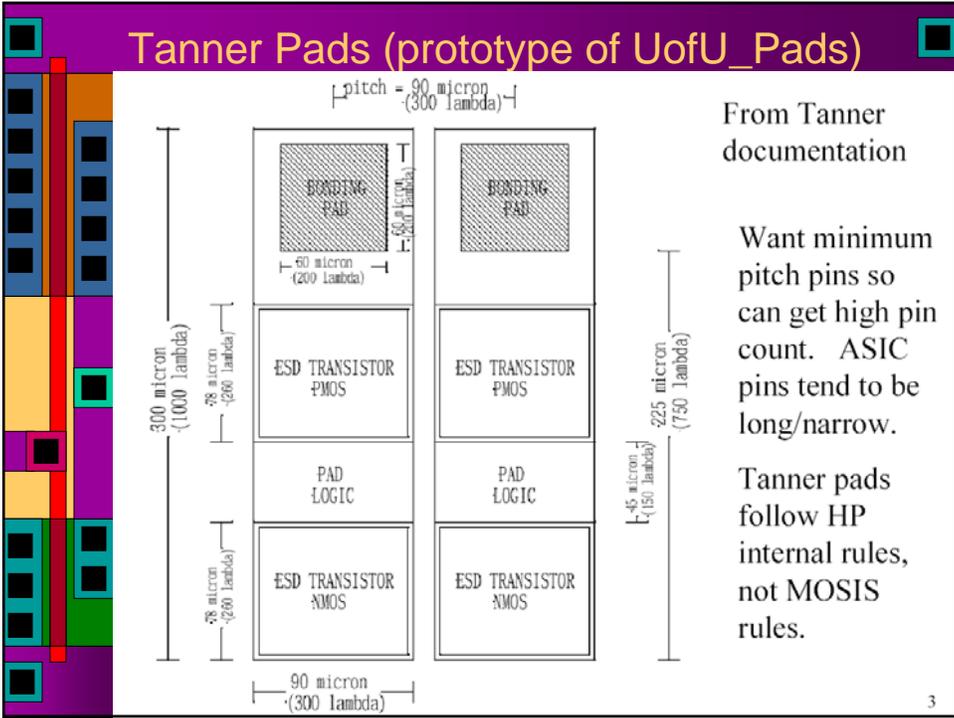

Tristate Buffers

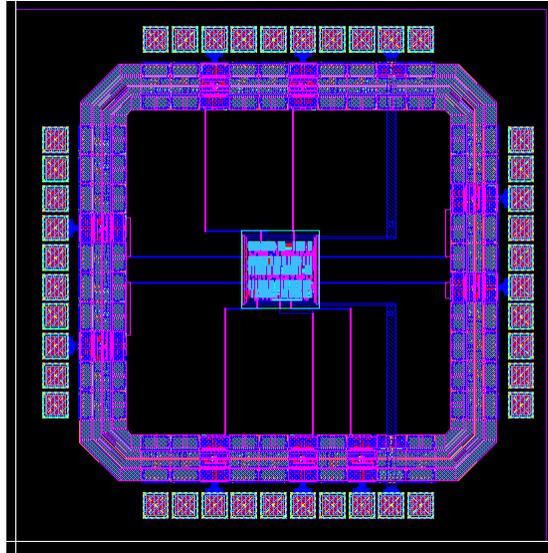

Bonding Pad Design

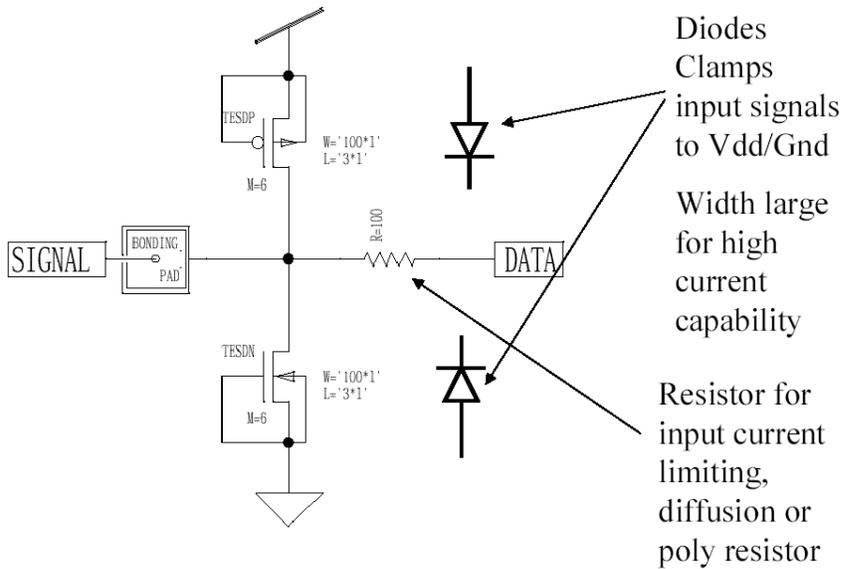

UofU_Pads

ESD and Analog Pads

Vdd/Gnd Input Signal clamping

BR 6/00

5

ESD Protection

A thick film device built from Met1, field oxide, and diffusion is used for ESD protection.

Field oxide device usually has threshold voltage in the 10's of volts.

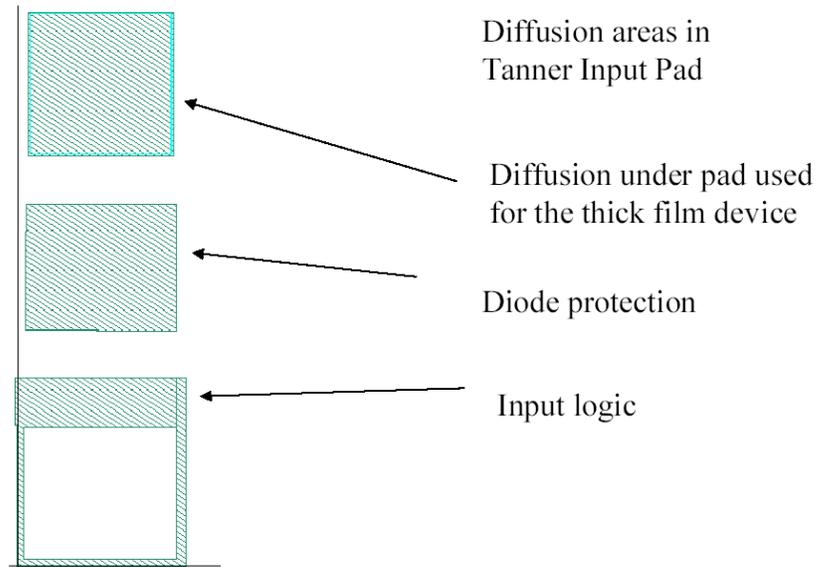

Metal 1 provides 'gate' of device, tied to pad, also tied to drain.

Width of device is very high to provide low on resistance, high current density.

Will handle any short duration spikes due to electro static discharge.

Most processes have special high threshold transistors that can be used for ESD protection instead of field oxide devices.

Pads from MOSIS

BR 6/00

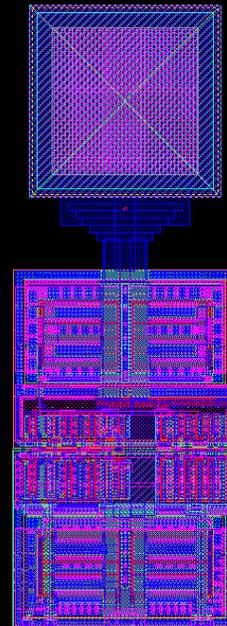

7

ASIC Pads

- Most ASIC pads have multiple Vdd/Gnd Rings
- Leda Systems 0.25u, 0.35u pad library has the following rings
 - Avdd, Avss -- analog VDD/Gnd
 - Evdd, Evss – external Vdd/Gnd – supports pads with different Vdd/Gnd from core
 - Nvdd, Nvss – internal Vdd/Gnd – core VDD/GND
 - Vss/Vdd -- ?? (also core Vdd/Gnd??)

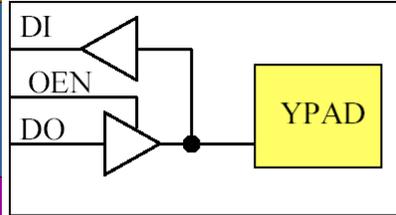

UofU Pads

- ▶ **pad_bidirhe**
 - ▶ Bidirectional pad with high enable
- ▶ **pad_in**
 - ▶ Digital input pad
- ▶ **pad_out**
 - ▶ Digital output pad
- ▶ **pad_vdd, pad_gnd**
 - ▶ Power supply pads
- ▶ **pad_io, pad_io_nores**
 - ▶ Analog pads (with and without series resistor)
- ▶ **pad_nc, pad_space**
 - ▶ Non-connecting pad and spacer

Pad Interfaces

- pad_bidirhe (bi-directional pad)

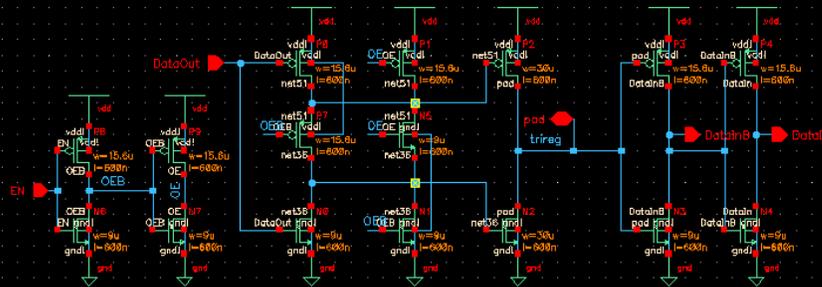

```
module pad_bidirhe (OEN,
DO, DI, YPAD);
```

```
input OEN;      (EN)
input DO;      (DataOut)
output DI;     (DataIn, DataInB)
inout YPAD;   (pad)
```

If OEN = '1', then YPAD = DO else YPAD = 'Z'.

- DataOut drives a 78(p) x 45(n) inverter (30x)
- Which then drives a 200(p) x 200(n) output driver (133x)
- DataIn and DataInB come from 96(p) x 54(n) inverters (36x)
- EN drives a 16(p) x 9(n) inverter (6x)
- All signal pads are built from this one
 - All signals on are M2

pad_bidirhe

- ▶ Moderately complex pullup/pulldown structure

pad_bidirhe

EN
DataOut

- ▶ M2 connections for EN, DataOut, DataIn, DataInB

The image shows a top-down view of a bidirectional pad. The pad is a large rectangular area with a grid of small squares. It is connected to a central pad (EN) and four data lines (DataOut, DataIn, DataInB). The connections are made using Metal 2 (M2) layers. The pad is labeled 'pad_bidirhe'.

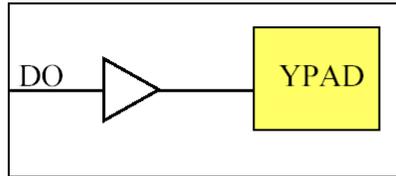

pad_bidirhe

- ▶ Look at just the metal layers...
 - ▶ EN, DataOut, DataInB, DataIn is the order
 - ▶ Middle connection is direct connection to the pad (don't use it!)
 - ▶ You put metal2 shape pins over the connection points (for icc)

The image shows a top-down view of a bidirectional pad, similar to the one above. It is labeled 'pad_bidirhe'. The image focuses on the metal layers and the connections between the pad and the data lines. The connections are made using Metal 2 (M2) layers. The pad is labeled 'pad_bidirhe'.

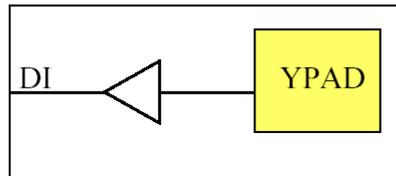

UofU Pads

- pad_out (output only pad)

```
module pad_out ( DO, YPAD);  
output YPAD; (pad)  
input DO; (DataOut)
```

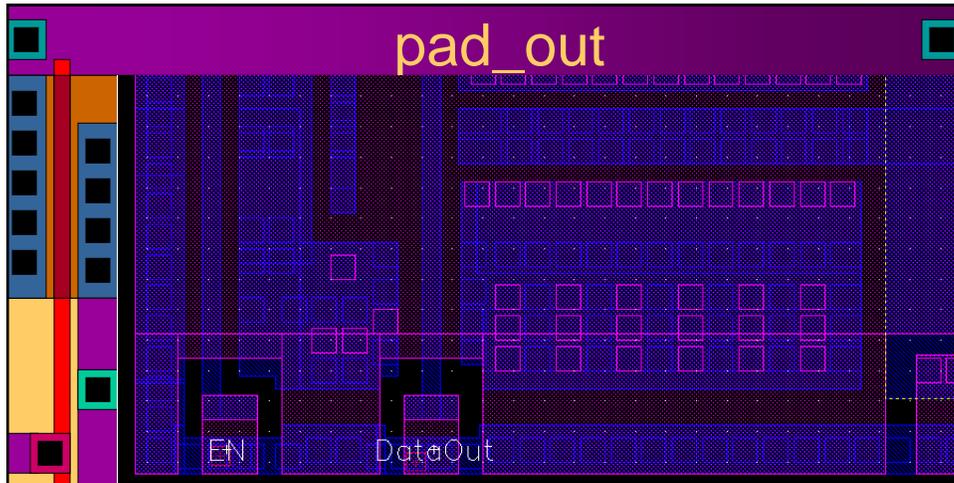

- pad_in (input only pad)

```
module pad_in ( DI, YPAD );  
output DI; (DataIn, DataInB)  
input YPAD; (pad)
```

pad_out

- ▶ Like pad_bidirhe but with EN already tied high for you
- ▶ All you need to connect is DataOut

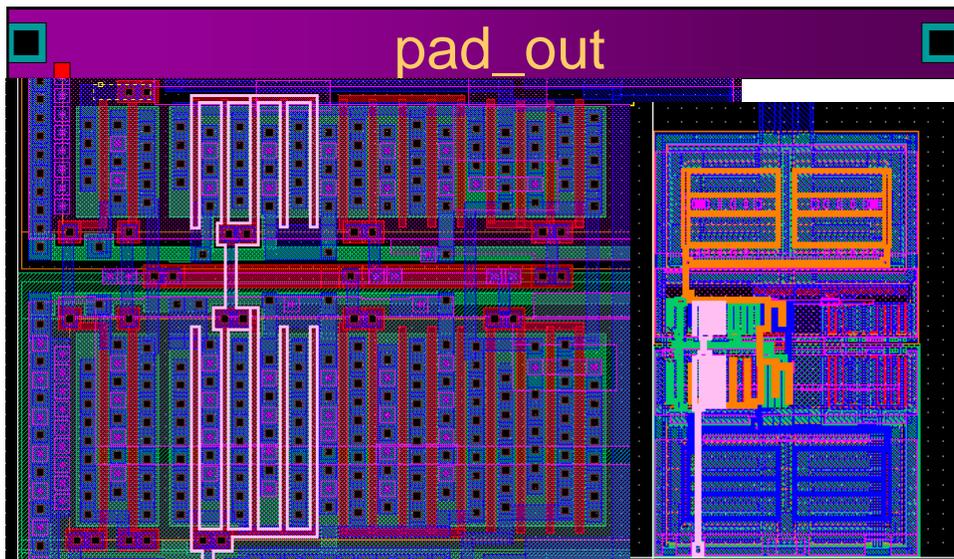

pad_out

EN DataOut

▶ You connect your signal to the DataOut connection into 78(p) x 45(n) inv (30x)

This diagram shows a top-down view of a microchip's pad_out interface. The chip is represented by a grid of purple and blue squares. A red vertical bar on the left side indicates the pad array. Two specific pads are highlighted with black boxes and labeled 'EN' and 'DataOut'. The 'DataOut' pad is connected to a signal line that extends to the right edge of the chip.

pad_out

▶ You connect your signal to the DataOut connection into 78(p) x 45(n) inv (30x)

This diagram shows a top-down view of a microchip's pad_out interface, similar to the first diagram. However, it includes a detailed view of the signal lines connecting the pads to the chip's internal circuitry. The signal lines are shown in white and red, and they connect to the 'DataOut' pad. The chip is represented by a grid of purple and blue squares. A red vertical bar on the left side indicates the pad array. Two specific pads are highlighted with black boxes and labeled 'EN' and 'DataOut'. The 'DataOut' pad is connected to a signal line that extends to the right edge of the chip.

pad_in

▶ Like pad_bidirhe but with EN tied low already for you

▶ Connect to the DataInB and DataIn port

The diagram shows a top-down view of an FPGA layout for a component named 'pad_in'. The layout is primarily purple with various colored regions (blue, orange, green, red) representing different functional blocks or routing resources. Two yellow arrows point upwards from the bottom edge of the layout, indicating connections to the DataInB and DataIn ports.

pad_in

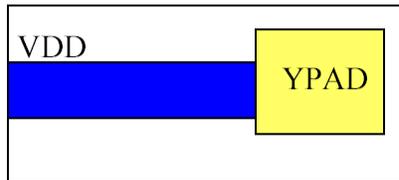

▶ DataIn and DataInB provide input signals

▶ Driven from 94(p) x 54(n) inverters (36x)

The diagram shows a top-down view of an FPGA layout for a component named 'pad_in'. The layout is primarily purple with various colored regions (blue, orange, green, red) representing different functional blocks or routing resources. Two labels, 'DataInB' and 'DataIn', are placed near the bottom edge of the layout, indicating the input signals.

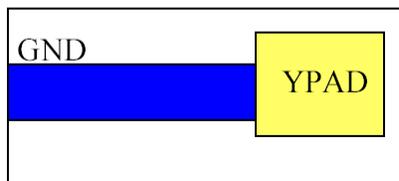

Power Supply Pads

- pad_vdd (vdd pad, vdd to core and pad rings)

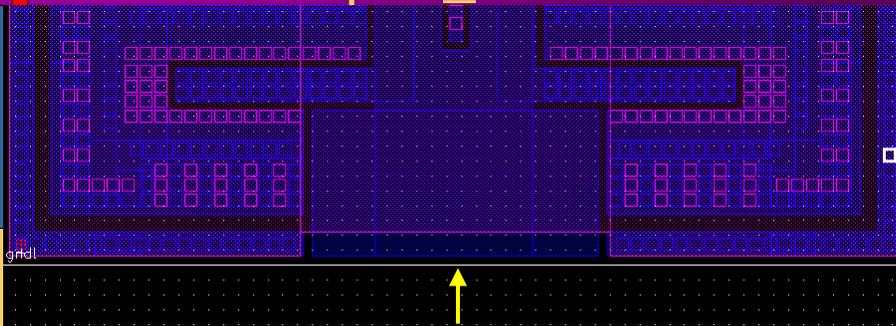

```
module pad_vdd (vdd, YPAD);  
inout YPAD, vdd;
```

- pad_gnd (gnd pad, gnd to core and pad rings)

```
module pad_gnd (vdd, YPAD);  
inout YPAD, gnd;
```

pad_vdd

- ▶ Vdd is on a big fat **metal1** line
- ▶ 28.8u wide

pad_gnd

- ▶ GND is also on a big fat **metal1** line
- ▶ Also 28.8u

More Pads

- PADNC (filler pad)

YPAD

```
module PADNC ();
```

A no-connection pad is used to fill out the padframe if you don't need the I/Os. Could also use extra Vdd/GND pads.

You don't want to use input/output pads with unconnected inputs because these can consume power if the inputs float.

Timetable

- ▶ Final Chip Assembly
 - ▶ Due **Wednesday December 13th**
 - ▶ Take the pad cells and make a pad ring
 - ▶ Connect your working core to the pad ring
- ▶ Remember that Tiny Chip Units are 1.5mm X 1.5mm and are not divisible
 - ▶ A 3.1mm X 2.8mm chip would cost 6 TCUs!
 - ▶ Preference will go to the well-simulated chips
 - ▶ Secondary preference will be for the smaller well-simulated chips

Available Frames

- ▶ Frame1_38
- ▶ Frame2h_70
- ▶ Frame2v_70
- ▶ Frame4_78
 - ▶ 1,2,4 indicate how many Tiny Chip Units
 - ▶ h and v indicate horizontal and vertical for the rectangular core frames
 - ▶ _# indicates how many signal pins are available
 - ▶ **Vdd and gnd are in the right spots – DON'T MOVE THEM!**

Frame1_38

40 pins total
(38 signal pins)
10 on each side

990 x 990 core

Save room for
Routing to pads!
900 x 900
Usable core

Frame1_38

27 28 29 30 31 32 34 35 36 37

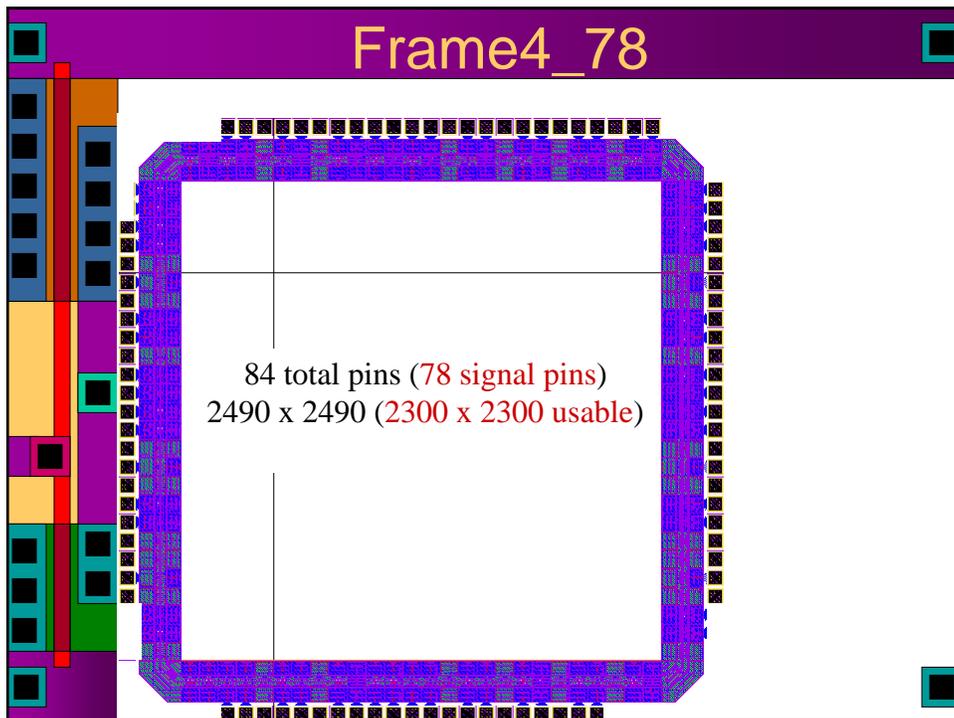

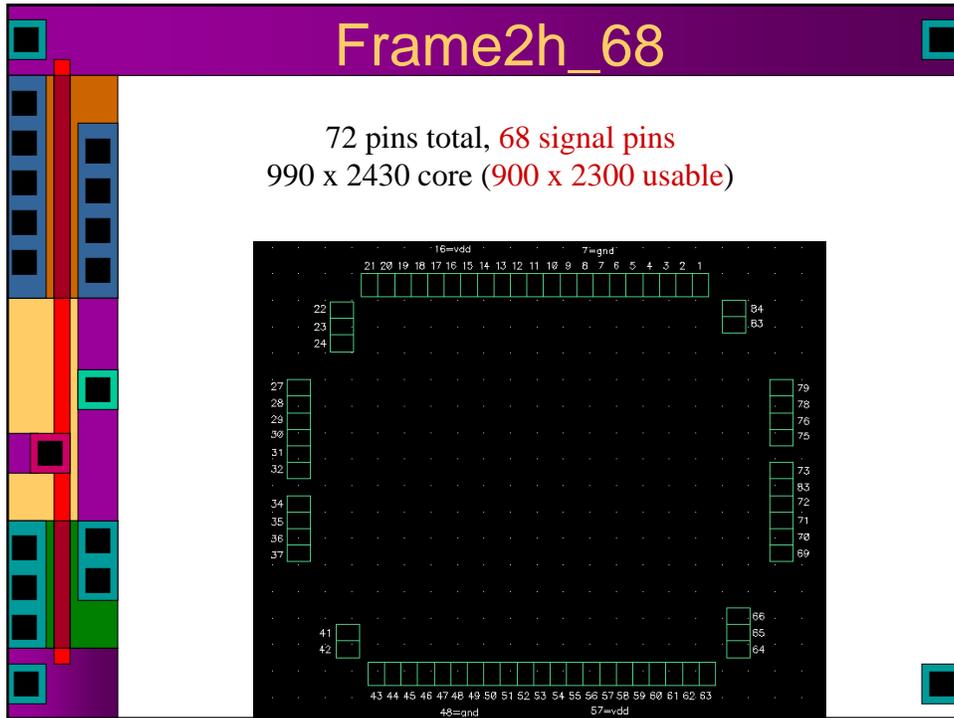

79 78 76 75 73 83 72 71 70 69

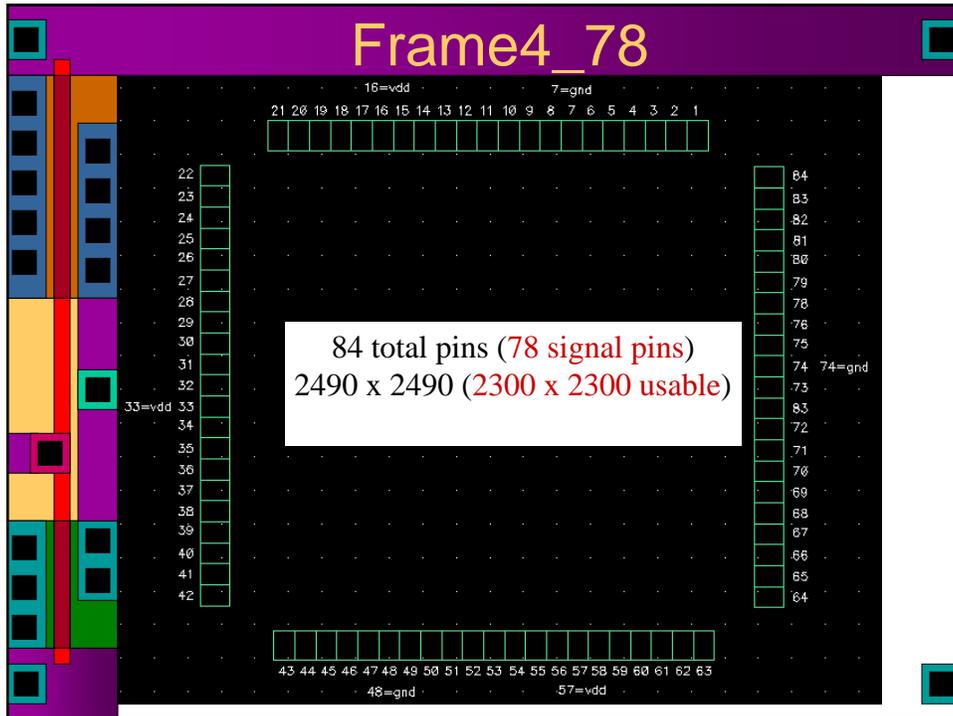

49 50 51 52 53 54 55 56 57 58

57=vdd

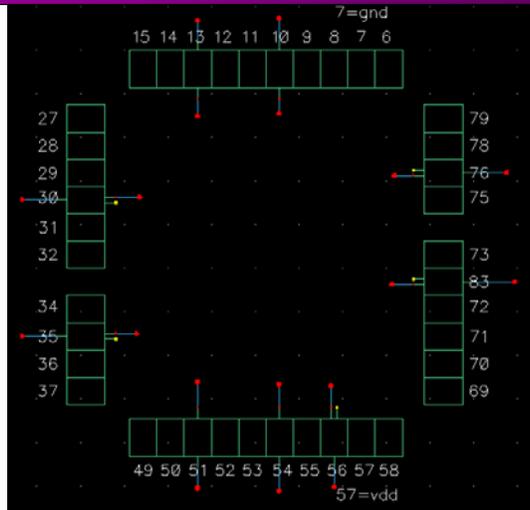

How to Use the Rings

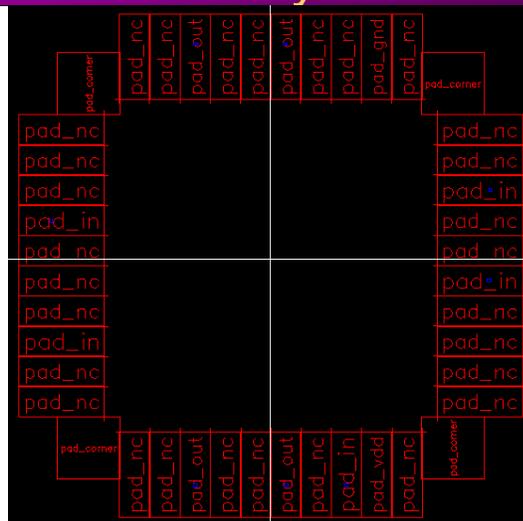

- ▶ Copy the pad ring of your choice
 - ▶ `/uusoc/facility/cad_common/local/Cadence/lib/UofU_Pads`
 - ▶ From **UofU_Pads**
 - ▶ To your project directory
- ▶ Leave the **pad_vdd** and **pad_gnd** where they are!
- ▶ Select other pads, use properties to change to the pad type you want
 - ▶ DON'T move them!
 - ▶ Use **pad_bidirhe**, **pad_out**, and **pad_in**

Frame Schematic

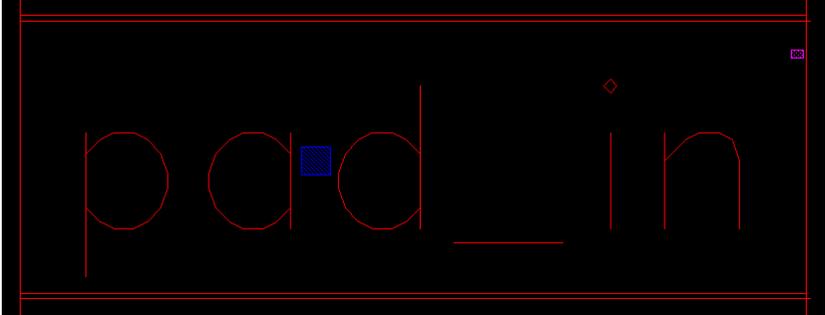

► Frame1_38 with the right pads for the drink_machine

Frame layout

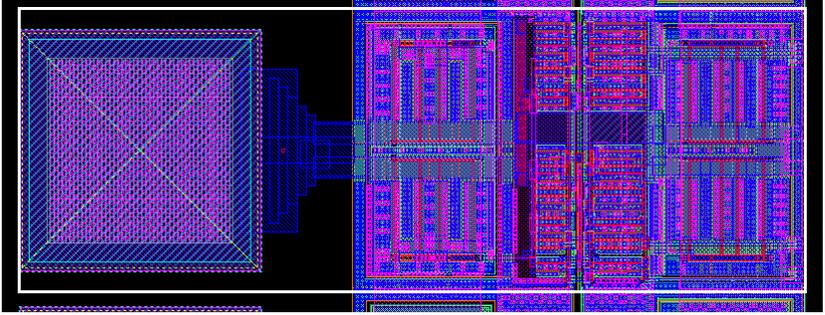

► Frame1_38 with the right pads for the drink_machine

Pins

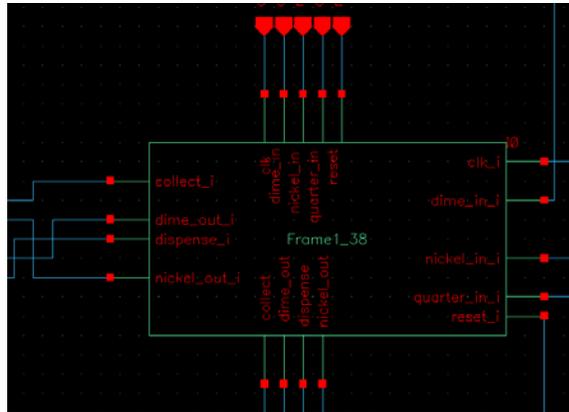

▶ Frame1_38 with the right pads for the drink_machine

Pins

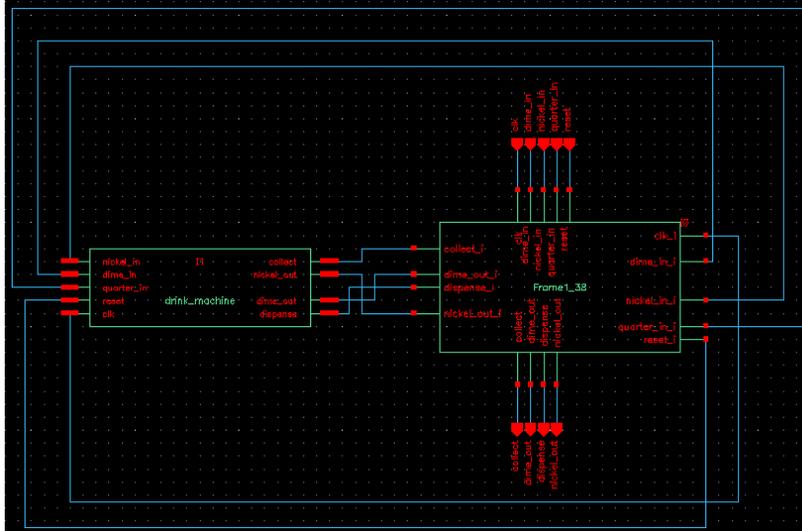

▶ Frame1_38 with the right pads for the drink_machine

Frame symbol

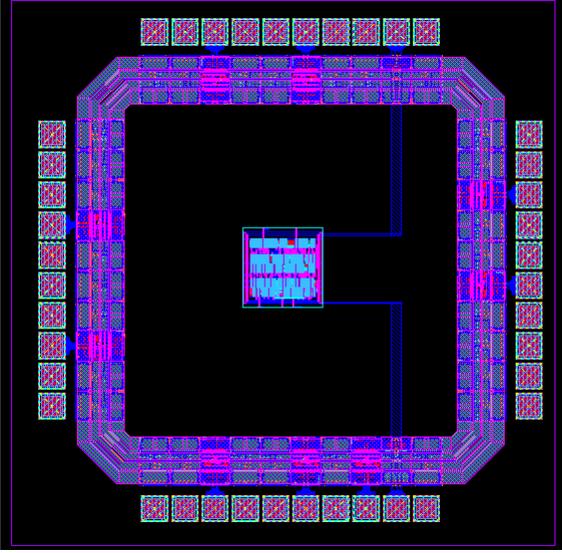

- ▶ Frame1_38 with the right pads for the drink_machine

Connect to Core

- ▶ Use this to start the `ccar` routing process

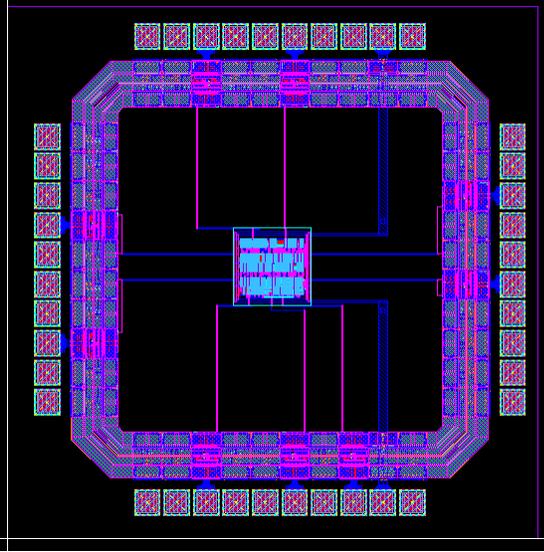

Layout with Virtuoso-XL

► Do placement, and connect vdd and gnd

The image shows a top-down view of a PCB layout in Virtuoso-XL. A central component is surrounded by a dense grid of routing lines. A central block of logic is visible, and the layout is enclosed in a square frame with a central cutout. The routing is shown in a grid pattern, with a central block of logic.

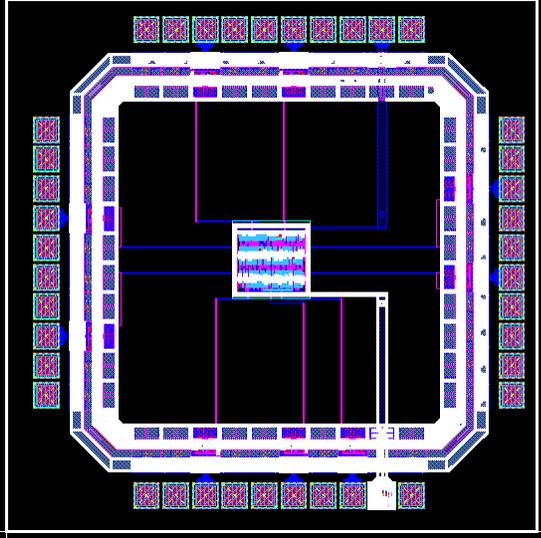

Connect with icc

► Let *ccar* the routing

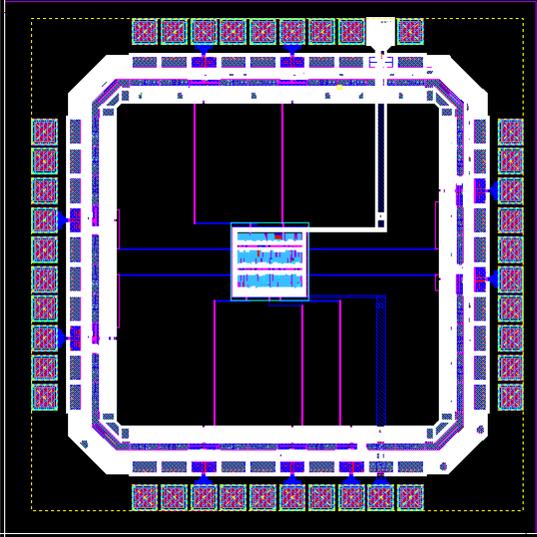

The image shows the same PCB layout as the previous slide, but with a different routing style. The routing lines are now shown in a more complex, non-grid pattern, indicating that the routing has been automated by the ICC tool. The central component and logic block are still visible, and the layout is enclosed in a square frame with a central cutout.

Vdd Connections

► Notice how the pad frame is connected

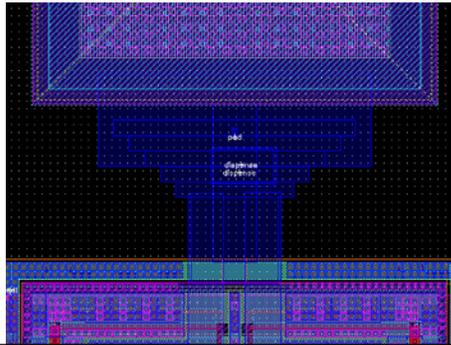

Gnd Connections

► Notice how the pad frame is connected

Now Simulate the Whole Chip

- ▶ Use essentially the same testbench that you used for the core
 - ▶ This time you'll be simulating with the pads in place
 - ▶ You'll need to place one more set of pins so that the wholechip cell has connection points

What Does This Mean?

- ▶ For now, concentrate on getting your chip core assembled, working, DRCed and LVSed.
 - ▶ You need a working core before you need pads!
- ▶ Make sure your core fits in the pad ring that you want to use
- ▶ Then, use **ccar** to assemble the frame and core
 - ▶ Simulate, LVS, DRC with the whole thing!

Output to GDS (Stream)

- ▶ Once everything is completely finished, you need to export the whole chip to **GDS (stream)** format
 - ▶ Use the `export->stream` function in CIW
 - ▶ In **User Defined Data**, use `stream4gds.map` as the **Layer Map Table**
 - ▶ From
`/uusoc/facility/cad_common/local/class/6710/cadence/map_files`
- ▶ Fill in **Library Name**, **Top Cell Name** and **Output File Name**
- ▶ I will read this GDS file in and re-DRC that layout...

Fabrication Schedule

- ▶ MOSIS educational run closes on **Jan 8th**
 - ▶ Chips that go into the fab queue need to be absolutely and completely ready to go **a few days before that** because of high ftp traffic
 - ▶ **Friday Jan 5th at the LATEST**
 - ▶ There are a few more steps that projects need to go through to make them fab-ready even after DRC/LVS
 - ▶ If you make logos and names, those have to pass DRC too!
 - ▶ Metal3 is recommended for logos...

Final Report

- ▶ Final Report, due Wednesday Dec 13th
- ▶ **Three** parts:
 - ▶ **First:** Technical Paper (about project)
 - ▶ Not more than 10 pages
 - ▶ IEEE two-column format
 - ▶ Describe what makes your chip interesting
 - ▶ This is a self-contained paper of the form that might be submitted to a conference or journal
 - ▶ **Second:** Project Details
 - ▶ Floorplan, pinout, and system block diagram
 - ▶ Schematics and layouts for all major parts
 - ▶ A table of contents or readme guide

Final Report

- ▶ **Third:** Standard Cells
 - ▶ Standard Cell layouts, schematics, etc.
 - ▶ User's guide
 - ▶ Email `.lib`, `.lef`, and `.v` files to me at teach-cs6710@cs.utah.edu
 - ▶ Also tell me where your libraries are.
 - ▶ I can slurp up the cell libraries if they are readable by your group.
