 Techsupport: [support.xilinx.com](mailto:support.xilinx.com)

## Introduction

With Xilinx LogiCORE PCI64 Spartan-II interface, a designer can build a customized, 64-bit, 0-33 MHz fully PCI compliant system with the highest possible sustained performance (264 Mbytes/sec) with up to 185,000 system gates in the Spartan-II FPGAs.

## Features

- Fully 2.2 PCI compliant 64-bit, 0-33 MHz PCI Initiator/Target Interface
- Zero wait-state burst operation
- Hot Swap CompactPCI friendly
- Programmable single-chip solution with customizable back-end functionality
- Pre-defined implementation for predictable timing in Xilinx Spartan-II FPGAs
- Incorporates Xilinx Smart-IP Technology
- Universal PCI support in Spartan-II
- 3.3 V and 5 V operation at 0-33 MHz
- Master automatically handles 64-bit or 32-bit PCI transactions without knowledge of target bus width
- Fully verified design tested with Xilinx testbench and hardware
- Configurable on-chip dual-port FIFOs can be added for maximum burst speed
- Supported Initiator functions
  - Memory Read, Memory Write, Memory Read Multiple (MRM), Memory Read Line (MRL) commands
  - I/O Read, I/O Write commands
  - Configuration Read, Configuration Write commands
  - Bus Parking
  - Special Cycles, Interrupt Acknowledge
  - Basic Host Bridging

LogiCORE™ Facts				
Core Specifics				
Device Family:	Spartan-II			
System Clock $f_{max}$ :	0-33MHz			
Device Features Used:	Bi-directional data buses SelectIO Block SelectRAM+™ (optional user FIFO)			
Supported Devices <sup>1</sup> /Percent Resources Used				
Devices	I/O	Slice flip flops	4-input LUTs	64 bit
2S50-2S200	32%- 51%	6%- 21%	11%- 38%	
Provided with Core				
Documentation;	<i>PCI Design Guide</i> <i>PCI Implementation Guide</i> <i>PCI Data Book</i>			
Design File Formats:	Verilog/VHDL Simulation Model Verilog/VHDL Instantiation Code NGO Netlist			
Constraints Files:	User Constraint File (UCF) Guide files			
Verification Tools:	Verilog/VHDL Testbench			
Reference designs & application notes:	Example designs: PING Reference Design, Synthesizable Asynchronous PCI FIFO			
Design Tool Requirements				
Xilinx Core Tools:	2.1i SP6, 3-1i			
Tested Entry/Verification Tools <sup>2</sup> :	For Core Instantiation: Synopsys FPGA Express, Synopsys FPGA Compiler, Synplicity Synplify, Exemplar Leonardo For Core Verification: Cadence Verilog XL, MTI ModelSim PE/Plus, Aldec Active-HDL			
Xilinx provides technical support for this LogiCORE™ product when used as described in the User's Guide and in the Application Notes. Xilinx cannot guarantee timing, functionality, or support of product if implemented in devices not listed above, or if customized beyond that referenced in the product documentation, or if any changes are made in sections of design marked as "DO NOT MODIFY".				

1. Re-targeting the PCI core to an unlisted device or package will void the guarantee of timing. See "Smart-IP Technology - guaranteed timing" for details.
2. See Xilinx Web Site for update on tested design tools.

## Features (cont.)

- Supported Target functions (PCI Master and Slave)
  - Type 0 Configuration Space Header
  - Up to 3 Base Address Registers (memory or I/O with adjustable block size from 16 Bytes to 2 GBytes, medium decode speed)
  - Parity Generation (PAR), Parity Error Detection (PERR# and SERR#)
  - Memory Read, Memory Write, Memory Read Multiple (MRM), Memory Read Line (MRL), Memory Write Invalidate (MWI) commands
  - I/O Read, I/O Write commands
  - Configuration Read, Configuration Write commands
  - Interrupt Acknowledge
  - 64-bit and 32-bit data transfers, burst transfers with linear address ordering
  - Target Abort, Target Retry, Target Disconnect
  - Full Command/Status Registers
- Available for configuration and download on the web
  - Web-based configuration tool
  - Generation of proven design files
  - Instant access to new releases

## Applications

- Embedded applications within telecommunication, networking, and industrial systems
- PCI add-in boards such as graphic cards, video adapters, LAN adapters and data acquisition boards
- Hot Swap CompactPCI boards
- Other applications that need PCI

## General Description

The LogiCORE™ PCI64 Interfaces are pre-implemented and fully tested modules for the Xilinx Spartan-II FPGAs. The pinout for the device and the relative placement of the internal Configurable Logic Blocks (CLBs) are pre-defined. Critical paths are controlled by TimeSpecs and guide files to ensure predictable timing. This significantly reduces engineering time required to implement the PCI portion of your design. Resources can instead be focused on the unique back-end logic in the FPGA and on the system level design. As a result, LogiCORE™ PCI products can minimize your product development time.

Xilinx Spartan-II FPGAs enable designs of fully PCI-compliant systems. The devices meet all required electrical and timing parameters including AC output drive characteristics, input capacitance specifications (10pF), 7 ns setup and 0 ns hold to system clock, and 6 ns system clock to output. These devices meet all specifications for PCI 3.3 V and 5 V.

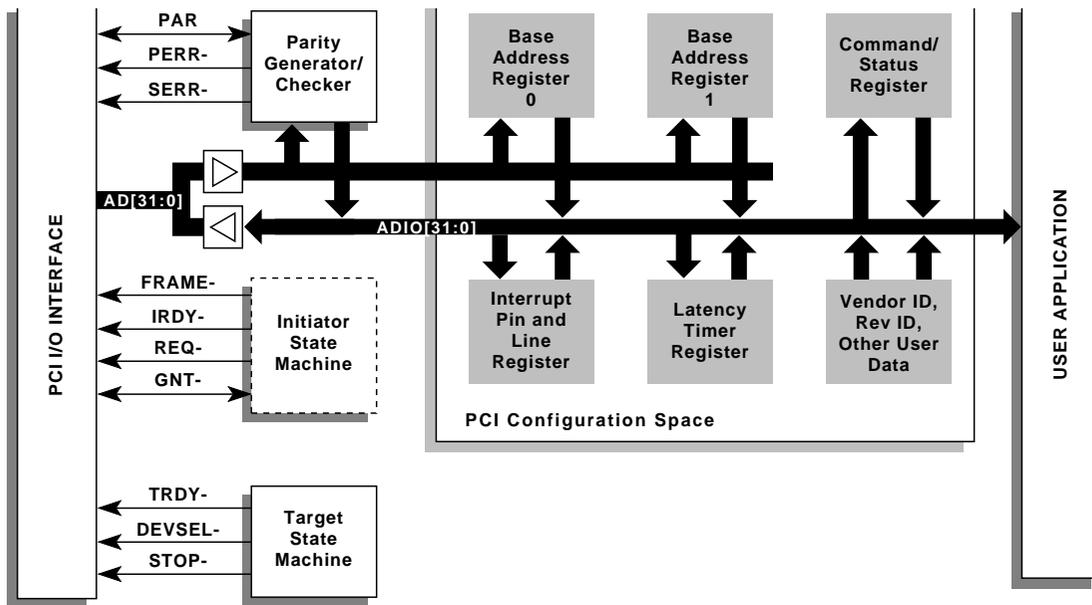

Figure 1: LogiCORE™ PCI64 Interface Block Diagram

X7954

The PCI Compliance Checklist has detailed information about electrical compliance. Other features that enable efficient implementation of a complete PCI system in Spartan-II includes:

- Block SelectRAM+™ memory: Blocks of on-chip ultra-fast RAM with synchronous write and dual-port RAM capabilities. Used in PCI Interfaces to implement FIFO
- Select-RAM™ memory: on-chip ultra-fast RAM with synchronous write option and dual-port RAM option. Used in PCI Interfaces to implement FIFO
- Individual output enable for each I/O
- Internal 3-state bus capability
- 8 global low-skew clock or signal distribution networks
- IEEE 1149.1-compatible boundary scan logic support
- Designed for CompactPCI Hot Swap support

The Master and Slave Interface module is carefully optimized for best possible performance and utilization in the Spartan-II FPGA architecture.

## Smart-IP Technology - Guaranteed Timing

Drawing on the architectural advantages of Xilinx FPGAs, new Xilinx Smart-IP technology ensures highest performance, predictability, repeatability, and flexibility in PCI designs. The Smart-IP technology is incorporated in every LogiCORE PCI core.

Xilinx Smart-IP technology leverages the Xilinx architectural advantages, such as look-up tables (LUTs), distributed RAM, and segmented routing, as well as floor planning information, such as logic mapping and relative location constraints. This technology provides the best physical layout, predictability, and performance. Additionally, these predetermined features allow for significantly reduced compile times over competing architectures.

PCI cores made with Smart-IP technology are unique because they maintain their performance and predictability regardless of the device size.

To guarantee the critical setup, hold, and min. and max. clock-to-out timing, the PCI core is delivered with Smart-IP constraints files that are unique for a device and package combination. These constraints files guide the implementation tools so that the critical paths always are within PCI specification. Retargeting the PCI core to an unsupported device will void the guarantee of timing. Contact one of the Xilinx XPERTs partners for support of unlisted devices and package combinations. See the XPERTs section in chapter 7 of the Xilinx PCI Data Book for contact information.

## Universal PCI Support

The capability of the Spartan-II FPGAs to operate in either 3.3 V or 5 V PCI environment, enables the designer to easily build universal PCI cards. This requires loading one of the bitstreams at power up. Refer to the *PCI Implementa-*

*tion Guide and Building a Universal PCI Card using Xilinx FPGAs Application Note.*

## Functional Description

The LogiCORE PCI64 Master and Slave Interface is partitioned into five major blocks and an user application as shown in Figure 1. Each block is described below.

### PCI Configuration Space

This block provides the first 64 Bytes of Type 0, version 2.1 Configuration Space Header (CSH) (see Table 1), to support software-driven “Plug-and Play” initialization and configuration. This includes information for Command, Status, and three Base Address Registers (BARs). These BARs illustrate how to implement memory- or I/O-mapped address spaces.

**Table 1: PCI Configuration Space Header**

31		16 15		0	
Device ID		Vendor ID		00h	
Status		Command		04h	
Class Code			Rev ID		08h
<i>BIST</i>	Header Type	Latency Timer	<i>Cache Line Size</i>		0Ch
Base Address Register 0 (BAR0)					10h
Base Address Register 1 (BAR1)					14h
Base Address Register 2 (BAR2)					18h
<i>Base Address Register 3 (BAR3)</i>					1Ch
<i>Base Address Register 4 (BAR5)</i>					20h
<i>Base Address Register 5 (BAR5)</i>					24h
<i>Cardbus CIS Pointer</i>					28h
Subsystem ID		Subsystem Vendor ID		2Ch	
<i>Expansion ROM Base Address</i>					30h
Reserved			CapPtr		34h
Reserved					38h
Max_Lat	Min_Gnt	Interrupt Pin	Interrupt Line		3Ch
Reserved					40h-FFh

Note: Address in shaded areas are not implemented in LogiCORE PCI32 Spartan-II Interface default configuration. These locations return zero during configuration read accesses.

Each BAR sets the base address for the interface and allows the system software to determine the addressable range required by the interface. Every BAR designated as a

memory space can be made to represent a 32-bit or a 64-bit space.

Using a combination of Configurable Logic Block (CLB) flip-flops for the read/write registers and CLB look-up tables for the read-only registers results in optimized logic mapping and placement.

The capability for extending configuration space has been built into the backend interface. This capability, including the ability to implement a CapPtr in configuration space, allows the user to implement functions, such as Advanced Configuration and Power Interface (ACPI), in the backend design.

### PCI I/O Interface Block

The I/O interface block handles the physical connection to the PCI bus including all signaling, input and output synchronization, output three-state controls, and all request-grant handshaking for bus mastering.

### Parity Generator/Checker

This block generates/checks even parity across the AD bus, the CBE lines, PAR and the PAR64 signal. It also reports data parity errors via PERR- and address parity errors via SERR-.

### Target State Machine

This block controls the PCI interface for Target functions. The states implemented are a subset of equations defined in "Appendix B" of the *PCI Local Bus Specification*. The controller is a high-performance state machine using one-hot (state-per-bit) encoding for maximum performance. State-per-bit encoding of the next-state logic functions facilitates a high performance implementation in the Xilinx FPGA architecture.

### Initiator State Machine

This block controls the PCI interface for Initiator functions. The states implemented are a subset of equations defined in "Appendix B" of the *PCI Local Bus Specification*. The Initiator Control Logic also uses state-per-bit encoding for maximum performance.

### User Application with Optional Burst FIFOs

The LogiCORE PCI64 Interface provides a simple, general-purpose interface with a 64-bit data path and latched address for de-multiplexing the PCI address/data bus. This user interface allows the rest of the device to be used in a wide range of 32-bit and 64-bit applications.

Typically, the user application contains burst FIFOs to increase PCI system performance. An on-chip read/write FIFO, built from the on-chip synchronous dual-port RAM

(Block SelectRAM+™) available in Spartan-II FPGAs, supports data transfers in excess of 66 MHz.

Several synthesizable re-usable bridge designs including commonly used backend functions, such as doorbells and mailboxes, are provided with the core.

## Interface Configuration

The LogiCORE PCI64 Interface can easily be configured to fit unique system requirements by using Xilinx web-based PCI configuration tool or by changing the Verilog or VHDL configuration file. The following customization options are supported by the LogiCORE product and described in product documentation.

- Initiator or target functionality
- Base Address Register configuration (1-3 Registers, size and mode)
- Configuration Space Header ROM
- Initiator and target state machine (e.g., termination conditions, transaction types and request/transaction arbitration)
- Burst functionality
- User Application including FIFO (back-end design)

## Supported PCI Commands

Table 2 illustrates the PCI bus commands supported by the LogiCORE™ PCI64 Interface. The PCI Compliance Checklist has more details on supported and unsupported commands.

Table 2: PCI Bus Commands

CBE [3:0]	Command	PCI Master	PCI Slave
0000	Interrupt Acknowledge	Yes	Yes
0001	Special Cycle	Yes	Ignore
0010	I/O Read	Yes	Yes
0011	I/O Write	Yes	Yes
0100	Reserved	Ignore	Ignore
0101	Reserved	Ignore	Ignore
0110	Memory Read	Yes	Yes
0111	Memory Write	Yes	Yes
1000	Reserved	Ignore	Ignore
1001	Reserved	Ignore	Ignore
1010	Configuration Read	Yes	Yes
1011	Configuration Write	Yes	Yes
1100	Memory Read Multiple	Yes	Yes
1101	Dual Address Cycle	No <sup>1</sup>	Ignore
1110	Memory Read Line	Yes	Yes
1111	Memory Write Invalidate	No <sup>1</sup>	Yes

Note:

1. The Initiator can present these commands; however, they either require additional user-application logic to support them or are not thoroughly tested.

## Burst Transfer

The PCI bus derives its performance from its ability to support burst transfers. The performance of any PCI application depends largely on the size of the burst transfer. A FIFO to support PCI burst transfer can efficiently be implemented using the Spartan-II on-chip RAM features, both Distributed and Block SelectRAM+™.

Each Spartan-II CLB supports four 16x1 RAM blocks. This corresponds to 64 bits of single-ported RAM or 32 bits of dual-ported RAM, with simultaneous read/write capability.

## Bandwidth

Xilinx LogiCORE PCI64 Interface supports fully compliant zero wait-state burst operations for both sourcing and receiving data. This Interface supports a sustained bandwidth of up to 264 MBytes/sec. The design can be configured to take advantage of the ability of the LogiCORE PCI64 Interface to do very long bursts. Since the FIFO is not of fixed size, bursts can go on for as long as the chipset arbiter will allow. Furthermore, since the FIFOs and DMA are decoupled from the proven core, a designer can modify these functions without affecting the critical PCI timing.

The flexible Xilinx backend, combined with support for many different PCI features, gives users a solution that lends itself to being used in many high-performance applications. Xilinx is able to support different depths of FIFOs as well as dual port FIFOs, synchronous or asynchronous FIFOs and multiple FIFOs. The user is not limited to one DMA engine, hence, a DMA that fits a specific application can be designed.

The theoretical maximum bandwidth of a 64-bit, 33 MHz PCI bus is 264 MBytes/sec. Attaining this maximum bandwidth will depend on several factors, including the PCI design used, PCI chipset, the processor's ability to keep up with your data stream, the maximum capability of your PCI design, and other traffic on the PCI bus. Older chipsets and processors will tend to allow less bandwidth than newer ones.

No additional wait-states are inserted in response to a wait-state from another agent on the bus. Either IRDY or TRDY is kept asserted until the current data phase ends, as required by the V2.2 PCI Specification.

See Table 3 for PCI bus transfer rates for various operations.

**Table 3: LogiCORE PCI64 Transfer Rates**

Zero Wait-State Mode	
Operation	Transfer Rate
Initiator Write (PCI ← LogiCORE)	3-1-1-1
Initiator Read (PCI → LogiCORE)	4-1-1-1
Target Write (PCI → LogiCORE)	5-1-1-1
Target Read (PCI ← LogiCORE)	6-1-1-1

Note: Initiator Read and Target Write operations have effectively the same bandwidth for burst transfer.

## Timing Specification

The Spartan-II FPGA devices, together with the LogiCORE PCI64 product enable design of fully compliant PCI systems. The maximum speed at which your back-end is capable of running can be affected by the size of the design as well as by the loading of the hot signals coming directly from the PCI bus. Table 4 shows the key timing parameters for the LogiCORE PCI64 Interface that must be met for full PCI compliance.

**Table 4: 33 MHz Timing Parameters**

Parameter	Ref.	PCI Spec.		LogiCORE PCI32 Spartan-II-5	
		Min	Max	Min	Max
CLK Cycle Time	$T_{cyc}$	15	30	15 <sup>1</sup>	30
CLK High Time	$T_{high}$	6		6	
CLK Low Time	$T_{low}$	6		6	
CLK to Bus Signals Valid	$T_{ICKOF}$	2	6	2	6
CLK to REQ# and GNT# Valid	$T_{ICKOF}$	2	6	2	6
Tri-state to Active	$T_{on}$	2		2	
CLK to Tri-state	$T_{off}$		14		14 <sup>1</sup>
Bus Signal Setup to CLK (IOB)	$T_{PSD}$		3		3
Bus Signal Setup to CLK (CLB)			5		5 <sup>1</sup>
GNT# Setup to CLK	$T_{PSD}$		5		5
GNT# Setup to CLK (CLB)	$T_{PSD}$		5		5
Input Hold Time After CLK (IOB)	$T_{PHD}$		0		0
Input Hold Time After CLK (CLB)			0		0
RST# to Tri-state	$T_{rst-off}$		40		40

Notes:

1. Controlled by TIMESPECS, included in product.

## Verification Methods

Xilinx has developed a system-level testbench that allows simulation of an open PCI environment in which a LogiCORE-PCI-based design may be tested by itself or with other simulatable PCI agents. Included in these agents are a behavioral host and target, and several plug-in modules, including a PCI signal recorder and a PCI protocol monitor. Using these tools, the PCI developers can write microcode-style test scripts that can be used to verify different bus-operation scenarios, including those in the PCI Compliance Checklist.

The Xilinx PCI testbench is a powerful verification tool that is also used as the basis for verification of the PCI LogiCORE. The PCI LogiCORE is also tested in hardware for electrical, functional, and timing compliance.

## Ping64 Reference Design

The Xilinx PING64 Application example, delivered in Verilog and VHDL, has been developed to provide an easy-to-understand example which demonstrates many of the principles and techniques required to successfully use a LogiCORE PCI64 Interface in a System-on-a-Chip solution. The PING64 design is also used as a test vehicle for PCI core verification.

## Asynchronous PCI FIFO Design Note

The first-in first-out memory queue with independent read and write clocks and backup reference design is available for use with the LogiCORE PCI64 Interface. It is delivered in Verilog and VHDL as a drop-in module for the Spartan-II FPGAs.

This design supports data widths of 32, 36, 64, or 72 bits with memory depth of 63 locations implemented in Select RAM+. Figure 1 presents a block diagram of the design. The `pci_async_fifo` features fully synchronous and inde-

pendent clock domains for the read and write ports and back-up synchronous to the read clock. The design also supports full and empty status, along with almost-full and almost-empty flags and invalid read or write requests are rejected without affecting the FIFO state.

The `pci_async_fifo` data sheet lists the features and specifics of the PCI FIFO design.

## Device Utilization

The Target/Initiator options require a variable amount of CLB resources for the PCI64 Interface.

Utilization of the device can vary slightly, depending on the configuration choices made by the designer. Factors that can affect the size of the core are:

- Number of Base Address Registers Used. Turning off any unused BARs will save resources.
- Size of the BARs. Setting the BAR to a smaller size requires more flip-flops. A smaller address space requires more flip-flops to decode.

Latency timer. Disabling the latency timer will save resources. It must be enabled for bursting.

## Recommended Design Experience

The LogiCORE PCI64 Interface is pre-implemented; thereby allowing engineering focus at the unique back-end functions of a PCI design. Regardless, PCI is a high-performance system that is challenging to implement in any technology, ASIC or FPGA. Therefore, previous experience with building high-performance, pipelined FPGA designs using Xilinx implementation software, TIMESPECS, and guide files is recommended. The challenge to implement a complete PCI design including back-end functions varies depending on the configuration and the functionality of your application. Contact your local Xilinx representative for a closer review and estimation for your specific requirements.
