XC4000 XLA Specification Information

Definition of Terms

In the following tables, some specifications may be designated as Advance or Preliminary. These terms are defined as follows:

Advance: Initial estimates based on simulation and/or extrapolation from other speed grades, devices, or families. Values are subject to change. Use as estimates, not for production.

Preliminary: Based on preliminary characterization. Further changes are not expected.

Unmarked: Specifications not identified as either Advance or Preliminary are to be considered final.

Occasionally, values are of mixed classification. These are highlighted in bold face and the tables involved include a note explaining the nature of the bold face entries. All specifications are subject to change without notice.

Additional Specifications

Except for pin-to-pin input and output parameters, the AC parameter delay specifications included in this document are derived from measuring internal test patterns. All specifications are representative of worst-case supply voltage and junction temperature conditions. The parameters included are common to popular designs and typical applications.

XC4000XLA D.C. Characteristic Guidelines

Absolute Maximum Ratings

Symbol	Description		Values	Units
V_{CC}	Supply voltage relative to GND		-0.5 to 4.0	V
V_{IN}	Input voltage relative to GND (Note 1)		-0.5 to 5.5	V
V_{TS}	Voltage applied to 3-state output (Note 1)		-0.5 to 5.5	V
V_{CCt}	Longest Supply Voltage Rise Time from 1 V to 3V		50	ms
T_{STG}	Storage temperature (ambient)		-65 to +150	°C
T_{SOL}	Maximum soldering temperature (10 s @ 1/16 in. = 1.5 mm)		+260	°C
T_J	Junction temperature	Ceramic packages	+150	°C
		Plastic packages	+125	°C

Notes: 1. Maximum DC overshoot or undershoot above V_{cc} or below GND must be limited to either 0.5 V or 10 mA, whichever is easier to achieve. During transitions, the device pins may undershoot to -2.0 V or overshoot to + 7.0 V, provided this over- or undershoot lasts less than 10 ns and with the forcing current being limited to 200 mA.

2. Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time may affect device reliability.

Recommended Operating Conditions

Symbol	Description		Min	Max	Units
V_{CC}	Supply voltage relative to GND, T_J = 0 °C to +85°C	Commercial	3.0	3.6	V
	Supply voltage relative to GND, T_J = -40°C to +100°C	Industrial	3.0	3.6	V
V_{IH}	High-level input voltage		50% of V_{CC}	5.5	V
V_{IL}	Low-level input voltage		0	30% of V_{CC}	V
T_{IN}	Input signal transition time			250	ns

Note: At junction temperatures above those listed as Operating Conditions, all delay parameters increase by 0.35% per °C. Input and output measurement threshold is ~50% of V_{CC}.

DC Characteristics Over Recommended Operating Conditions

Symbol	Description		Min	Max	Units
V_{OH}	High-level output voltage @ I_{OH} = -4.0 mA, V_{CC} min (LVTTL)		2.4		V
	High-level output voltage @ I_{OH} = -500 µA, (LVCMOS)		90% V_{CC}		V
V_{OL}	Low-level output voltage @ I_{OL} = 24.0 mA, V_{CC} min (LVTTL) (Note 1)			0.4	V
	Low-level output voltage @ I_{OL} = 1500 µA, (LVCMOS)			10% V_{CC}	V
V_{DR}	Data Retention Supply Voltage (below which configuration data may be lost)		2.5		V
I_{CCO}	Quiescent FPGA supply current (Note 2)			10	mA
I_L	Input or output leakage current		-10	+10	µA
C_{IN}	Input capacitance (sample tested)	BGA, SBGA, PQ, HQ, MQ packages		10	pF
		PGA packages		16	pF
I_{RPU}	Pad pull-up (when selected) @ V_{in} = 0 V (sample tested)		0.02	0.25	mA
I_{RPD}	Pad pull-down (when selected) @ V_{in} = 3.6 V (sample tested)		0.02	0.15	mA
I_{RLL}	Horizontal Longline pull-up (when selected) @ logic Low		0.3	2.0	mA

Notes: 1. With up to 64 pins simultaneously sinking 24 mA
2. With no output current loads, no active input or Longline pull-up resistors, all I/O pins Tri-stated and floating

XC4000 XLA Switching Characteristics

Testing of the switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.

When fewer vertical clock lines are connected, the clock distribution is faster; when multiple clock lines per column are driven from the same global clock, the delay is longer. For more specific, more precise, and worst-case guaranteed data, reflecting the actual routing structure, use the values provided by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature. Values apply to all XC4000XLA devices and expressed in nanoseconds unless otherwise noted.

Delay Via Global Low Skew Clock Buffer to Clock

		Speed Grade	All	-09	-08	-07	Units
Description	**Symbol**	**Device**	**Min**	**Max**	**Max**	**Max**	
Delay from pad through Global Low Skew (GLS) clock buffer to any clock input, K.	T_{GLS}	XC4013XLA	0.7	2.4	2.1	1.9	ns

XC4000XLA Pin-to-Pin Output Parameter Guidelines

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Pin-to-pin timing parameters are derived from measuring external and internal test patterns and are guaranteed over worst-case operating conditions (supply voltage and junction temperature). Listed below are representative values for typical pin locations and normal clock loading. For more specific, more precise, and worst-case guaranteed data, reflecting the actual routing structure, use the values provided by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. Values are expressed in nanoseconds unless otherwise noted.

Global Clock Input to Output Delay

		XC4062XLA	0.9	6.5	5.9	5.3	ns
		XC4085XLA	0.9	6.9	6.2	5.6	ns
			Preliminary				

Notes: Listed above are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.
Output timing is measured at ~50% V_{CC} threshold with 50 pF external capacitive load. For different loads, see Figure 1.

Global Early Clock Input to Output Delay for BUFGE #s 3, 4, 7, and 8

Description	Symbol	Speed Grade / Device	All Min	-09 Max	-08 Max	-07 Max	Units
Global Clock Signal Input to Output Delay using Global Early (GE) clock buffer to clock Output Flip-Flop for BUFGE #s 3, 4, 7, & 8.	T_{ICKEOF}	XC4013XLA	1.1	5.7	5.1	4.5	ns
		XC4020XLA	1.1	5.9	5.3	4.7	ns
		XC4028XLA	1.2	6.1	5.4	4.9	ns
		XC4036XLA	1.3	6.3	5.6	5.0	ns
		XC4044XLA	1.3	6.5	5.8	5.2	ns
		XC4052XLA	1.4	6.8	6.0	5.4	ns
		XC4062XLA	1.5	7.0	6.3	5.6	ns
		XC4085XLA	1.6	7.5	6.7	6.0	ns
			Preliminary				

Notes: Listed above are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.
Output timing is measured at ~50% V_{CC} threshold with 50 pF external capacitive load. For different loads, see Figure 1.

Capacitive Load Factor

Figure 1 shows the relationship between I/O output delay and load capacitance. It allows a user to adjust the specified output delay if the load capacitance is different than 50 pF. For example, if the actual load capacitance is 120 pF, add 2.5 ns to the specified delay. If the load capacitance is 20 pF, subtract 0.8 ns from the specified output delay.

Figure 1 is usable over the specified operating conditions of voltage and temperature and is independent of the output slew rate control.

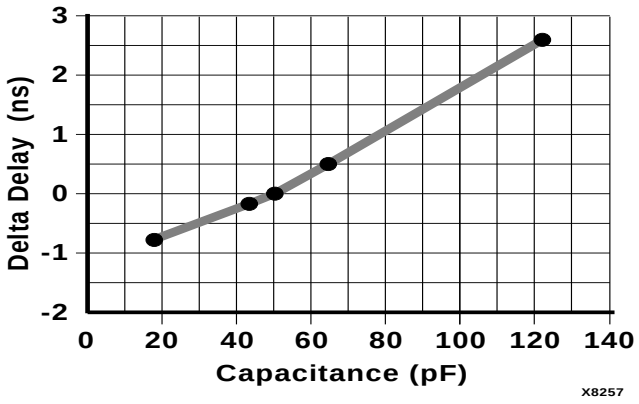

Figure 1: Delay Factor at Various Capacitive Loads

XC4000XLA Pin-to-Pin Input Parameter Guidelines

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Pin-to-pin timing parameters are derived from measuring external and internal test patterns and are guaranteed over worst-case operating conditions (supply voltage and junction temperature). Listed below are representative values for typical pin locations and normal clock loading. For more specific, more precise, and worst-case guaranteed data, reflecting the actual routing structure, use the values provided by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. Values are expressed in nanoseconds unless otherwise noted.

Preliminary

IFF = Input Flip-Flop or Latch

Note: Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal using the furthest distance and a reference load of one clock pin per two IOBs. Use the static timing analyzer (TRCE) to determine the setup and hold times under given design conditions.

Note: Setup time is measured with the fastest route and the lightest load. Hold time is measured using the furthest distance and a reference load of one clock pin per two IOBs. Use the static timing analyzer(TRCE) to determine the setup and hold times under given design conditions.

BUFGE #s 1, 2, 5, and 6 Global Early Clock, Set-up and Hold for IFF and FCL

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Pin-to-pin timing parameters are derived from measuring external and internal test patterns and are guaranteed over worst-case operating conditions (supply voltage and junction temperature). Listed below are representative values for typical pin locations and normal clock loading. For more specific, more precise, and worst-case guaranteed data, reflecting the actual routing structure, use the values provided by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. Values are expressed in nanoseconds unless otherwise noted.
