

Virtex Electrical Characteristics

Definition of Terms

The status of data sheets is designated as Advance or Preliminary. These specifications are defined as follows:

Advance: Initial estimates based on simulation and/or extrapolation from other speed grades, devices, or families. Values are subject to change. Use as estimates, not for production.

Preliminary: Based on preliminary characterization. Further changes are not expected.

Unmarked: Data sheets not identified as either Advance or Preliminary are to be considered final.

All specifications are representative of worst-case supply voltage and junction temperature conditions. The parameters included are common to popular designs and typical applications. Contact the factory for design considerations requiring more detailed information.

All specifications are subject to change without notice.

V_{REF}	Input Reference Voltage	-0.5 to 3.6	V
V_{IN}	Input voltage relative to GND ⁽³⁾	Using V_{REF}	-0.5 to 3.6
		Internal threshold	-0.5 to 5.5
V_{TS}	Voltage applied to 3-state output	-0.5 to 5.5	V

T_{STG}	Storage temperature (ambient)	-65 to +150	°C
T_J	Junction temperature ⁽⁴⁾	Plastic Packages +125	°C

Notes:

- Stresses beyond those listed under Absolute Maximum Ratings can cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time can affect device reliability.
- Power supplies can turn on in any order.
- For protracted periods (e.g., longer than a day), V_{IN} should not exceed V_{CCO} by more than 3.6 V.
- For soldering guidelines and thermal considerations, see the [Device Packaging](#) information on the Xilinx website.

Recommended Operating Conditions

Symbol	Description		Min	Max	Units
$V_{CCINT}^{(1)}$	Input Supply voltage relative to GND, $T_J = 0\text{ °C to }+85\text{ °C}$	Commercial	2.5 - 5%	2.5 + 5%	V
	Input Supply voltage relative to GND, $T_J = -40\text{ °C to }+100\text{ °C}$	Industrial	2.5 - 5%	2.5 + 5%	V
$V_{CCO}^{(4)}$	Supply voltage relative to GND, $T_J = 0\text{ °C to }+85\text{ °C}$	Commercial	1.4	3.6	V

T_{IN}	Input signal transition time			250	ns

Notes:

- Correct operation is guaranteed with a minimum V_{CCINT} of 2.375 V (Nominal V_{CCINT} -5%). Below the minimum value, all delay parameters increase by 3% for each 50-mV reduction in V_{CCINT} below the specified range.
- At junction temperatures above those listed as Operating Conditions, delay parameters do increase. Please refer to the TRCE report.
- Input and output measurement threshold is ~50% of V_{CC} .
- Min and Max values for V_{CCO} are I/O Standard dependant.

Notes:

1. With no output current loads, no active input pull-up resistors, all I/O pins 3-stated and floating.
2. Internal pull-up and pull-down resistors guarantee valid logic levels at unconnected input pins. These pull-up and pull-down resistors do not guarantee valid logic levels when input pins are connected to other circuits.
3. Multiply I_{CCINTQ} limit by two for industrial grade.

Power-On Power Supply Requirements

Xilinx FPGAs require a certain amount of supply current during power-on to insure proper device operation. The actual current consumed depends on the power-on ramp rate of the power supply. This is the time required to reach the nominal power supply voltage of the device⁽¹⁾ from 0 V. The current is highest at the fastest suggested ramp rate (0 V to nominal voltage in 2 ms) and is lowest at the slowest allowed ramp rate (0 V to nominal voltage in 50 ms).

Product	Description ⁽²⁾	Current Requirement ^(1,3)
Virtex Family, Commercial Grade	Minimum required current supply	500 mA
Virtex Family, Industrial Grade	Minimum required current supply	2 A

Notes:

- Ramp rate used for this specification is from 0 - 2.7 VDC. Peak current occurs on or near the internal power-on reset threshold and lasts for less than 3 ms.
- Devices are guaranteed to initialize properly with the minimum current available from the power supply as noted above.
- Larger currents can result if ramp rates are forced to be faster.

DC Input and Output levels

Values for V_{IL} and V_{IH} are recommended input voltages. Values for I_{OL} and I_{OH} are guaranteed output currents over the recommended operating conditions at the V_{OL} and V_{OH} test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at minimum V_{CC0} for each standard with the respective V_{OL} and V_{OH} voltage levels shown. Other standards are sample tested.

Virtex Switching Characteristics

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values. For more specific, more precise, and worst-case guaranteed data, use the values reported

by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation net list. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature). Values apply to all Virtex devices unless otherwise noted.

Notes:

- I/O parameter measurements are made with the capacitance values shown above. See Xilinx Application Note [XAPP133](#) for appropriate terminations.
- I/O standard measurements are reflected in the IBIS model information except where the IBIS format precludes it.

For other capacitive loads, use the formulas below to calculate the corresponding $T_{i\text{oop}}$.

$$T_{i\text{oop}} = T_{i\text{oop}} + T_{\text{opadadjust}} + (C_{\text{load}} - C_{\text{sl}}) * fl$$

Where:

$T_{\text{opadadjust}}$ is reported above in the Output Delay Adjustment section.

C_{load} is the capacitive load for the design.

Notes:

- Listed above are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.
- Input and output timing is measured at 1.4 V for LVTTTL. For other I/O standards, see [Table 2](#). In all cases, an 8 pF external capacitive load is used.

Virtex Pin-to-Pin Input Parameter Guidelines

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Listed below are representative values for typical pin locations and normal clock loading. Values are expressed in nanoseconds unless otherwise noted

Global Clock Set-Up and Hold for LVTTL Standard, *with DLL*

No Delay Global Clock and IFF, with DLL	T_{PSDLL}/T_{PHDLL}	XCV50	0.40 / -0.4	1.7 / -0.4	1.8 / -0.4	2.1 / -0.4	ns, min
		XCV100	0.40 / -0.4	1.7 / -0.4	1.9 / -0.4	2.1 / -0.4	ns, min

		XCV400	0.40 / -0.4	1.7 / -0.4	1.9 / -0.4	2.1 / -0.4	ns, min
		XCV600	0.40 / -0.4	1.7 / -0.4	1.9 / -0.4	2.1 / -0.4	ns, min
		XCV800	0.40 / -0.4	1.7 / -0.4	1.9 / -0.4	2.1 / -0.4	ns, min
		XCV1000	0.40 / -0.4	1.7 / -0.4	1.9 / -0.4	2.1 / -0.4	ns, min

IFF = Input Flip-Flop or Latch

Notes:

1. Set-up time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
2. DLL output jitter is already included in the timing calculation.
3. A Zero "0" Hold Time listing indicates no hold time or a negative hold time. Negative values can not be guaranteed "best-case", but if a "0" is listed, there is no positive hold time.

Notes: Notes:

DLL Timing Parameters

Switching parameters testing is modeled after testing methods specified by MIL-M-38510/605; all devices are 100 percent functionally tested. Because of the difficulty in directly measuring many internal timing parameters, those parameters are derived from benchmark timing patterns. The following guidelines reflect worst-case values across the recommended operating conditions.

Description	Symbol	Speed Grade						Units
		-6		-5		-4		
		Min	Max	Min	Max	Min	Max	
Input Clock Frequency (CLKDLLHF)	FCLKINHf	60	200	60	180	60	180	MHz
Input Clock Frequency (CLKDLL)	FCLKINLf	25	100	25	90	25	90	MHz
Input Clock Pulse Width (CLKDLLHF)	T _{DLLPWHf}	2.0	-	2.4	-	2.4	-	ns
Input Clock Pulse Width (CLKDLL)	T _{DLLPWLf}	2.5	-	3.0	-	3.0	-	ns

Notes:

- All specifications correspond to Commercial Operating Temperatures (0°C to +85°C).

DLL Clock Tolerance, Jitter, and Phase Information

All DLL output jitter and phase specifications determined through statistical measurement at the package pins using a clock mirror configuration and matched drivers.

		30 - 40 MHz	-	-	-	90	µs
		25 - 30 MHz	-	-	-	120	µs
Output Jitter (cycle-to-cycle) for any DLL Clock Output ⁽¹⁾	T _{OJITCC}			± 60		± 60	ps

Maximum Phase Difference between Clock Outputs on the DLL ⁽⁵⁾	T _{PHOOM}			± 200		± 200	ps

Notes:

- Output Jitter** is cycle-to-cycle jitter measured on the DLL output clock, *excluding* input clock jitter.
- Phase Offset between CLKIN and CLKO** is the worst-case fixed time difference between rising edges of CLKIN and CLKO, *excluding* Output Jitter and input clock jitter.
- Phase Offset between Clock Outputs on the DLL** is the worst-case fixed time difference between rising edges of any two DLL outputs, *excluding* Output Jitter and input clock jitter.
- Maximum Phase Difference between CLKIN and CLKO** is the sum of Output Jitter and Phase Offset between CLKIN and CLKO, or the greatest difference between CLKIN and CLKO rising edges due to DLL alone (*excluding* input clock jitter).
- Maximum Phase Difference between Clock Outputs on the DLL** is the sum of Output Jitter and Phase Offset between any two DLL clock outputs, or the greatest difference between any two DLL output rising edges due to DLL alone (*excluding* input clock jitter).
- All specifications correspond to Commercial Operating Temperatures (0°C to +85°C).

Period Tolerance: the allowed input clock period change in nanoseconds.

Output Jitter: the difference between an ideal reference clock edge and the actual design.
