

Wireless-II Electrical Characteristics

Wireless-II devices are provided in -1, -1.5, and -1.8 speed grades, with -1.5 offering the highest performance.

Wireless-II (S) and (M) characteristics are specified for both commercial and industrial grades. Except for operating temperature ranges, wireless characteristics, unlike (S) and (M) electrical parameters, are the same for a particular speed grade. That is, the timing characteristics of a -1.5 speed grade industrial device are the same as for a -1.5 speed grade com-

mercial device. However, only selected speed grades and/or devices might be available in the industrial range.

All supply voltage and junction temperature specifications are representative of aluminum solutions. The parameters listed are common to popular designs and typical applications. Contact Xilinx for design considerations requiring more detailed information.

All specifications are subject to change without notice.

Table 1. Absolute Maximum Ratings

Symbol	Description	Min.	Max.	Units
V_{DDmax}	Internal supply voltage relative to GND	-0.5	+1.05	V
V_{DDmin}	Auxiliary supply voltage relative to GND	-0.5	+1.0	V
$V_{DDIOmax}$	Input/output supply voltage relative to GND	-0.5	+1.0	V
$V_{DDIOmin}$	IOV (input/output) relative to GND	-0.5	+1.0	V
V_{DDI}	IOV (input) voltage	-0.5	+1.0	V
V_{DDO}	IOV (output) relative to output pin and internal node	-0.5	+1.0	V
V_{DDQ}	Memory supply relative to internal power and internal node	-0.5	+1.0	V
T_{max}	Storage temperature (ambient)	-55	+125	°C
T_{jmax}	Maximum junction temperature	125		°C
T_c	Operating ambient temperature	-40		°C

Notes:

1. **DO NOT EXCEED ABSOLUTE MAXIMUM RATING LIMITS UNDER ANY CIRCUMSTANCES.** A violation requires a device to meet design conditions and/or operate at the edge when under voltage.

Table 2. Recommended Operating Conditions

Symbol	Description	Min.	Max.	Units	
V_{DDmax}	Internal supply voltage relative to GND, T_c at 0°C to +40°C	Commercial	1.500	1.575	V
	Internal supply voltage relative to GND, T_c at -40°C to +125°C	Industrial	1.500	1.575	V
V_{DDmin}	Auxiliary supply voltage relative to GND, T_c at 0°C to +40°C	Commercial	0.0	0.0	V
	Auxiliary supply voltage relative to GND, T_c at -40°C to +125°C	Industrial	0.0	0.0	V
V_{DDIO}	Supply voltage relative to GND, T_c at 0°C to +40°C	Commercial	1.2	0.0	V
	Supply voltage relative to GND, T_c at -40°C to +125°C	Industrial	1.2	0.0	V
V_{DDQ}	Auxiliary voltage relative to GND, T_c at 0°C to +40°C	Commercial	1.0	0.0	V
	Auxiliary voltage relative to GND, T_c at -40°C to +125°C	Industrial	1.0	0.0	V

Notes:

1. If V_{DDmin} and V_{DDIO} are both 0.0 V, they must use a common supply voltage.
2. If V_{DDmin} is not 0.0 V, do not exceed V_{DDmin} .
3. For all temperatures, storage 0.0 V to 0.0 V and max is 0.0 V.

2. If I/Os are (1) or (2) alternative capabilities, load, then calculate power/dissipation estimates that fit accordingly using the Power Dissipation Equation.
3. Values are listed for V_{DDIO} steps of 0.1V.

Power-On Power Supply Requirements

While FPGAs require a certain amount of supply current during power-on to ensure proper device operation, the actual current requirement depends on the placement and usage rate of the power supply.

The V_{DD1MIN} , V_{DD2MIN} , and V_{DD3MIN} power supplies shall ramp up no faster than 100 ps and no slower than 10 ns. Ramp up is defined as if V_{DD} is minimum supply voltage.

V_{DD1MIN} and V_{DD2MIN} for both 4 must be connected together (to V_{DD1}) to meet the following specification.

Table 4 shows the minimum current required by Virtex-4 devices for proper power on and configuration.

Power supplies can be turned on in any sequence, as long as V_{DD1MIN} and V_{DD2MIN} are connected together to ramp up.

If any V_{DD} device ramps up before V_{DD1MIN} , that particular device goes into the W_n state, and the V_{DD1MIN} ramps up. This state can occur because if the current is limited to the minimum value above, or above, that configuration is properly after all three supplies have passed through their power-on reset/hold-off voltage.

Once initialized and configured, use the power calculator to estimate current draw on these supplies.

Notes:

1. V_{DD1MIN} and V_{DD2MIN} are connected together.

DC Input and Output Levels

Values for V_{in} and V_{out} are recommended input voltage. Values for I_{in} and I_{out} are guaranteed over the entire nominal operating conditions at the V_{in} and V_{out} test points. Only selected standards are tested. These are also

used to ensure that all standards meet their specifications. The selected standards are tested at minimum V_{in} with the negative V_{in} and the voltage levels shown. Other standards are sample tested.

Wire-0 Performance Characteristics

This section provides the performance characteristics of some common functions and designs implemented in wire-0 devices. The numbers represented are worst case values; they have all been fully characterized. Note that these values are subject to the same guidelines as [Wire-0 Switching Characteristics](#) (page 9) listed here.

Table 11 provides pin-to-pin values (in nanoseconds) including 50-picosecond, that is, delay through the device from input to output, in the case of multiple inputs, and not just pins. The worst delay is reported.

Write-0 Switching Characteristics

Switching characteristics are specified for a per-pin-performance and are broken into the Advances, Preliminary, or Protection. Note that [Write-0 Performance Characteristics page 6](#) are subject to these guidelines, as well. Each characteristic definition follows:

Advances: These speed files are located in situations only where typically available over other device design speed files and buses. Although speed grades with this designation are considered ready-to-use, and sometimes come under engineering support only.

Preliminary: These speed files are based on complete EPL programming sample silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advances files.

Protection: These speed files are released once enough production silicon of a particular die family number has been characterized to provide full correlation between speed files and devices over numerous production lots. There is no under-reporting of delays, and customer receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Protection before faster speed grades.

Testing of Buffering Characteristics

All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Worst values are representative values. For more specific, more precise, and accurate parameter data,

ICB Input Buffering Characteristics

Input delays associated with the pin are specified for all I/O modes. For other constants, refer the delays with

Notes: (Initial) Family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device. [Table 10](#) contains the current status of each I/O mode device with a corresponding speed file migration.

Notes:

1. Values shown are representative values and global data that show characteristics for all part numbers within the 100 series unless noted, and shown as indicated (100 and 1000) by those indicated by the global data cell.
2. Output delays to maximum 100% duty factor with the 100% rise time require the 100% rise time. For other duty factors and rise times, see [Table 8A](#).
3. 100% duty factor is always within maximum constraints.

DCM Timing Parameters

Timing of existing parameters is modified after timing methods specified by `SETUP_METHODS`. All delays are 100% functionality unless otherwise explicitly indicated. Measuring many internal timing parameters, these parameters are defined from functional timing patterns. The following

timing guidelines reflect worst-case values across the recommended operating conditions. All output data are phase specifications as determined through internal measurement at the package pins.

Revision History

This section records the change history for this module of the data sheet.

Issue	Revision	Revisions
1997/01	1.0	Early access draft
2002/01	1.1	Initial release
2007/02	1.2	Added values to the tables in the Version 0 Performance Characteristics and Version 0 Loading Characteristics sections.
2007/02	1.3	The data sheet was divided into four modules (per the current style standard). Values were added and revised (values in the following sections): <ul style="list-style-type: none"> 1. Version 0 Performance Characteristics 1. Version 0 Loading Characteristics 1. DCM Firing Parameters 1. Table 01 - Core Measurement Methodology (on page 01)
2008/01	1.4	Updated values in the tables in the Version 0 Performance Characteristics and Version 0 Loading Characteristics sections. <ul style="list-style-type: none"> 1. Added Tables updated to Table 01. 1. Added unit to spec with other modules. Reverted to traditional double column format.
2008/01	1.5	Updated characteristic values in the Version 0 Performance Characteristics and Table 01 Loading Characteristics tables. <ul style="list-style-type: none"> 1. Added values to the Version 0 Pico/Pic/Output Parameter Sublines and Version 0 Pico/Pic/Input/Parameter Sublines tables. 1. Added Frequency Spillover table.
2008/01	1.7	Updated values in the Version 0 Performance Characteristics and Version 0 Loading Characteristics tables. <ul style="list-style-type: none"> 1. Replaced the speed grade designations used for data sheets, and added Table 01, which shows the current speed grade designations for each device.
2008/01	1.8	Revised the speed grade designations for the electrical tables in Table 01 .
