

## Virtex-II Electrical Characteristics

Virtex-II devices are provided in -4, -5, and -6 speed grades, with -6 having the highest performance.

Virtex-II DC and AC characteristics are specified for both commercial and industrial grades. Except the operating temperature range or unless otherwise noted, all the DC and AC electrical parameters are the same for a particular speed grade (that is, the timing characteristics of a -4 speed grade industrial device are the same as for a -4 speed grade com-

mercial device). However, only selected speed grades and/or devices might be available in the industrial range.

All supply voltage and junction temperature specifications are representative of worst-case conditions. The parameters included are common to popular designs and typical applications. Contact Xilinx for design considerations requiring more detailed information.

All specifications are subject to change without notice.

V <sub>IN</sub> <sup>(3)</sup>	Input voltage relative to GND (user and dedicated I/Os)	-0.5 to V <sub>CCO</sub> + 0.5	V
V <sub>TS</sub>	Voltage applied to 3-state output (user and dedicated I/Os)	-0.5 to 4.0	V
T <sub>STG</sub>	Storage temperature (ambient)	-65 to +150	°C
T <sub>SOL</sub>	Maximum soldering temp.	+220	°C
T <sub>J</sub>	Operating junction temperature <sup>(2)</sup>	+125	°C

### Notes:

- Stresses beyond those listed under Absolute Maximum Ratings might cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time might affect device reliability.
- For soldering guidelines and thermal considerations, see the [Device Packaging](#) information on the Xilinx website.
- Inputs configured as PCI are fully PCI compliant. This statement takes precedence over any specification that would imply that the device is not PCI compliant.

Table 2: Recommended Operating Conditions

	Supply voltage relative to GND, $T_J = -40\text{ }^{\circ}\text{C}$ to $+100\text{ }^{\circ}\text{C}$	Industrial	1.2	3.6	V
$V_{BATT}$	Battery voltage relative to GND, $T_J = 0\text{ }^{\circ}\text{C}$ to $+85\text{ }^{\circ}\text{C}$	Commercial	1.0	3.6	V
	Battery voltage relative to GND, $T_J = -40\text{ }^{\circ}\text{C}$ to $+100\text{ }^{\circ}\text{C}$	Industrial	1.0	3.6	V

**Notes:**

1. If battery is not used, do not connect  $V_{BATT}$ .
2. Recommended maximum voltage droop for  $V_{CCAUX}$  is 10 mV/ms.
3. The thresholds for Power On Reset are  $V_{CCINT} > 1.2\text{ V}$ ,  $V_{CCAUX} > 2.5\text{ V}$ , and  $V_{CCO}$  (Bank 4)  $> 1.5\text{ V}$ .
4. Limit the noise at the power supply to be within 200 mV peak-to-peak.
5. For power bypassing guidelines, see XAPP623 at [www.xilinx.com](http://www.xilinx.com).

**Notes:**

1. With no output current loads, no active input pull-up resistors, all I/O pins are 3-state and floating.
2. If DCI or differential signaling is used, more accurate values can be obtained by using the Power Estimator or XPOWER™.
3. Data are retained even if V<sub>CCO</sub> drops to 0 V.
4. Values specified for quiescent supply current parameters are Commercial Grade. For Industrial Grade values, multiply Commercial Grade values by 1.25.

## Power-On Power Supply Requirements

Xilinx FPGAs require a certain amount of supply current during power-on to insure proper device operation. The actual current consumed depends on the power-on ramp rate of the power supply.

The V<sub>CCINT</sub>, V<sub>CCAUX</sub>, and V<sub>CCO</sub> power supplies shall each ramp on no faster than 200 μs and no slower than 50 ms. Ramp on is defined as: 0 V<sub>DC</sub> to minimum supply voltages.

Table 5 shows the minimum current required by Virtex-II devices for proper power on and configuration.

Power supplies can be turned on in any sequence.

If any V<sub>CCO</sub> bank powers up before V<sub>CCAUX</sub>, then each bank draws up to 300 mA, worst case, until the V<sub>CCAUX</sub> powers on<sup>(1)</sup>. This does not harm the device. If the current is limited to the minimum value above, or larger, the device powers on properly after all three supplies have passed through their power on reset threshold voltages.

Once initialized and configured, use the power calculator to estimate current drain on these supplies.

**Notes:**

1. The 300 mA is transient current (peak); it eventually disappears even if V<sub>CCAUX</sub> does not power up.

$I_{CCOMIN}$	50	50	100	100	100	100	100	TBD

**Notes:**

1. Values specified for power on current parameters are Commercial Grade. For Industrial Grade values, multiply Commercial Grade values by 1.25.
2.  $I_{CCOMIN}$  values listed here apply to the entire device (all banks).

## General Power Supply Requirements

Proper decoupling of all FPGA power supplies is essential. Consult Xilinx [Application Note 623](#) for detailed information on power distribution system design.

$V_{CCAUX}$  powers critical resources in the FPGA. Thus,  $V_{CCAUX}$  is especially susceptible to power supply noise.

Changes in  $V_{CCAUX}$  voltage outside of 200 mV peak to peak should take place at a rate no faster than 10 mV per millisecond. Techniques to help reduce jitter and period distortion

are provided in Xilinx Answer Record 13756, available at [www.support.xilinx.com](http://www.support.xilinx.com).

$V_{CCAUX}$  can share a power plane with 3.3V  $V_{CCO}$ , but only if  $V_{CCO}$  does not have excessive noise. Using simultaneously switching output (SSO) limits are essential for keeping power supply noise to a minimum. (More information on SSO is available in Xilinx Answer Record 11713.)

## DC Input and Output Levels

Values for  $V_{IL}$  and  $V_{IH}$  are recommended input voltages. Values for  $I_{OL}$  and  $I_{OH}$  are guaranteed over the recommended operating conditions at the  $V_{OL}$  and  $V_{OH}$  test points. Only selected standards are tested. These are chosen

to ensure that all standards meet their specifications. The selected standards are tested at minimum  $V_{CCO}$  with the respective  $V_{OL}$  and  $V_{OH}$  voltage levels shown. Other standards are sample tested.

## Virtex-II Performance Characteristics

This section provides the performance characteristics of some common functions and designs implemented in Virtex-II devices. The numbers reported here are worst-case values; they have all been fully characterized. Note that these values are subject to the same guidelines as **Virtex-II Switching Characteristics**, page 9 (speed files).

**Table 11** provides pin-to-pin values (in nanoseconds) including IOB delays; that is, delay through the device from input pin to output pin. In the case of multiple inputs and outputs, the worst delay is reported.

## Virtex-II Switching Characteristics

Switching characteristics in this document are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Note that **Virtex-II Performance Characteristics, page 7** are subject to these guidelines, as well. Each designation is defined as follows:

**Advance:** These speed files are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

**Preliminary:** These speed files are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.

**Production:** These speed files are released once enough production silicon of a particular device family member has been characterized to provide full correlation between speed files and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

Since individual family members are produced at different times, the migration from one category to another depends

**Notes:**

1. I/O parameter measurements are made with the capacitance values shown above.
2. I/O standard measurements are reflected in the IBIS model information except where the IBIS format precludes it.
3. Use of IBIS models results in a more accurate prediction of the propagation delay:
  - a. Model the output in an IBIS simulation into the standard capacitive load.
  - b. Record the relative time to the  $V_{OH}$  or  $V_{OL}$  transition of interest.
  - c. Remove the capacitance, and model the actual PCB traces (transmission lines) and actual loads from the appropriate IBIS models for driven devices.
  - d. Record the results from the new simulation.
  - e. Compare with the capacitance simulation. The increase or decrease in delay from the capacitive load delay simulation should be added or subtracted from the value above to predict the actual delay.

#### Notes:

1. Listed above are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.
2. Output timing is measured with a 35 pF external capacitive load. The only time it is not 50% of  $V_{CC}$  threshold is with LVCMOS. For other I/O standards and different loads, see [Table 18](#).
3. DCM output jitter is included in the measurement.

1. IFF = Input Flip-Flop or Latch
2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
3. These values are parametrically measured.

## DCM Timing Parameters

All devices are 100% functionally tested. Because of the difficulty in directly measuring many internal timing parameters, those parameters are derived from benchmark timing patterns. The following guidelines reflect worst-case values

across the recommended operating conditions. All output jitter and phase specifications are determined through statistical measurement at the package pins.

### Notes:

1. "DLL outputs" is used here to describe the outputs: CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV.
2. If both DLL and CLKFX outputs are used, follow the more restrictive specification.
3. If the CLKIN\_DIVIDE\_BY\_2 attribute of the DCM is used, then double these values.

**Notes:**

1. "DLL outputs" is used here to describe the outputs: CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV.
2. CLKOUT\_DUTY\_CYCLE\_DLL applies to the 1X clock outputs (CLK0, CLK90, CLK180, and CLK270) only if DUTY\_CYCLE\_CORRECTION = TRUE.
3. Specification also applies to PSCLK.

		XC2V4000	TBD	TBD	TBD	ps
		XC2V6000	TBD	500	TBD	ps
XC2V8000	TBD	TBD	TBD	ps		

### Notes:

- These parameters represent the worst-case duty cycle distortion observable at the pins of the device using LVDS output buffers. For cases where other I/O standards are used, IBIS can be used to calculate any additional duty cycle distortion that might be caused by asymmetrical rise/fall times.  
 $T_{DCD\_CLK0}$  applies to cases where local (IOB) inversion is used to provide the negative-edge clock to the DDR element in the I/O.  
 $T_{DCD\_CLK180}$  applies to cases where the CLK180 output of the DCM is used to provide the negative-edge clock to the DDR element in the I/O.
- This value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx FPGA\_Editor and Timing Analyzer tools to evaluate clock skew specific to your application.

Table 43: Package Skew

Description	Symbol	Device/Package	Value	Units
Package Skew <sup>(1)</sup>	$T_{PKGSKEW}$	XC2V1000 / FF896	130	ps
		XC2V3000 / FF1152	115	ps
		XC2V3000 / BF957	130	ps
		XC2V4000 / FF1152	130	ps
		XC2V4000 / FF1517	200	ps
		XC2V4000 / BF957	140	ps
		XC2V6000 / FF1152	90	ps
		XC2V6000 / FF1517	105	ps
		XC2V6000 / BF957	105	ps

### Notes:

- These values represent the worst-case skew between any two balls of the package: shortest flight time to longest flight time from Pad to Ball (7.1ps per mm).
- Package trace length information is available for these device/package combinations. This information can be used to deskew the package.

		XC2V4000	TBD	500	TBD	ps
		XC2V6000	TBD	500	TBD	ps
		XC2V8000	TBD	TBD	TBD	ps

**Notes:**

- This parameter indicates the total sampling error of Virtex-II DDR input registers across voltage, temperature, and process. The characterization methodology uses the DCM to capture the DDR input registers' edges of operation. These measurements include:
  - CLK0 and CLK180 DCM jitter
  - Worst-case Duty-Cycle Distortion - T<sub>DCD\_CLK180</sub>
  - DCM accuracy (phase offset)
  - DCM phase shift resolution.
 These measurements do not include package or clock tree skew.

		XC2V8000	TBD	TBD	TBD	ns

**Notes:**

- IFF = Input Flip-Flop
- The timing values were measured using the fine-phase adjustment feature of the DCM.
- The worst-case duty-cycle distortion and DCM jitter on CLK0 and CLK180 is included in these measurements.

## Source Synchronous Timing Budgets

This section describes how to use the parameters provided in the **Source-Synchronous Switching Characteristics** section to develop system-specific timing budgets. The following analysis provides information necessary for determining Virtex-II contributions to an overall system timing analysis; no assumptions are made about the effects of Inter-Symbol Interference or PCB skew.

### Virtex-II Transmitter Data-Valid Window ( $T_X$ )

$T_X$  is the minimum aggregate valid data period for a source-synchronous data bus at the pins of the device and is calculated as follows:

$$T_X = \text{Data Period} - [\text{Jitter}^{(1)} + \text{Duty Cycle Distortion}^{(2)} + \text{TCKSKEW}^{(3)} + \text{TPKGSKEW}^{(4)}]$$

#### Notes:

1. Jitter values and accumulation methodology to be provided in a future release of this document. The absolute period jitter values found in the **DCM Timing Parameters** section of the particular DCM output clock used to clock the IOB FF can be used for a best case analysis.
2. This value depends on the clocking methodology used. See Note1 for **Table 42**.
3. This value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx FPGA\_Editor and Timing Analyzer tools to evaluate clock skew specific to your application.
4. These values represent the worst-case skew between any two balls of the package: shortest flight time to longest flight time from Pad to Ball.

### Virtex-II Receiver Data-Valid Window ( $R_X$ )

$R_X$  is the required minimum aggregate valid data period for a source-synchronous data bus at the pins of the device and is calculated as follows:

$$R_X = [\text{TSAMP}^{(1)} + \text{TCKSKEW}^{(2)} + \text{TPKGSKEW}^{(3)}]$$

#### Notes:

1. This parameter indicates the total sampling error of Virtex-II DDR input registers across voltage, temperature, and process. The characterization methodology uses the DCM to capture the DDR input registers' edges of operation. These measurements include:
  - CLK0 and CLK180 DCM jitter in a quiet system
  - Worst-case duty-cycle distortion
  - DCM accuracy (phase offset)
  - DCM phase shift resolution.
 These measurements do not include package or clock tree skew.
2. This value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx FPGA\_Editor and Timing Analyzer tools to evaluate clock skew specific to your application.
3. These values represent the worst-case skew between any two balls of the package: shortest flight time to longest flight time from Pad to Ball.
