

DPN-100 ISRB Engineering and Scalability Guidelines

Gary Palmer

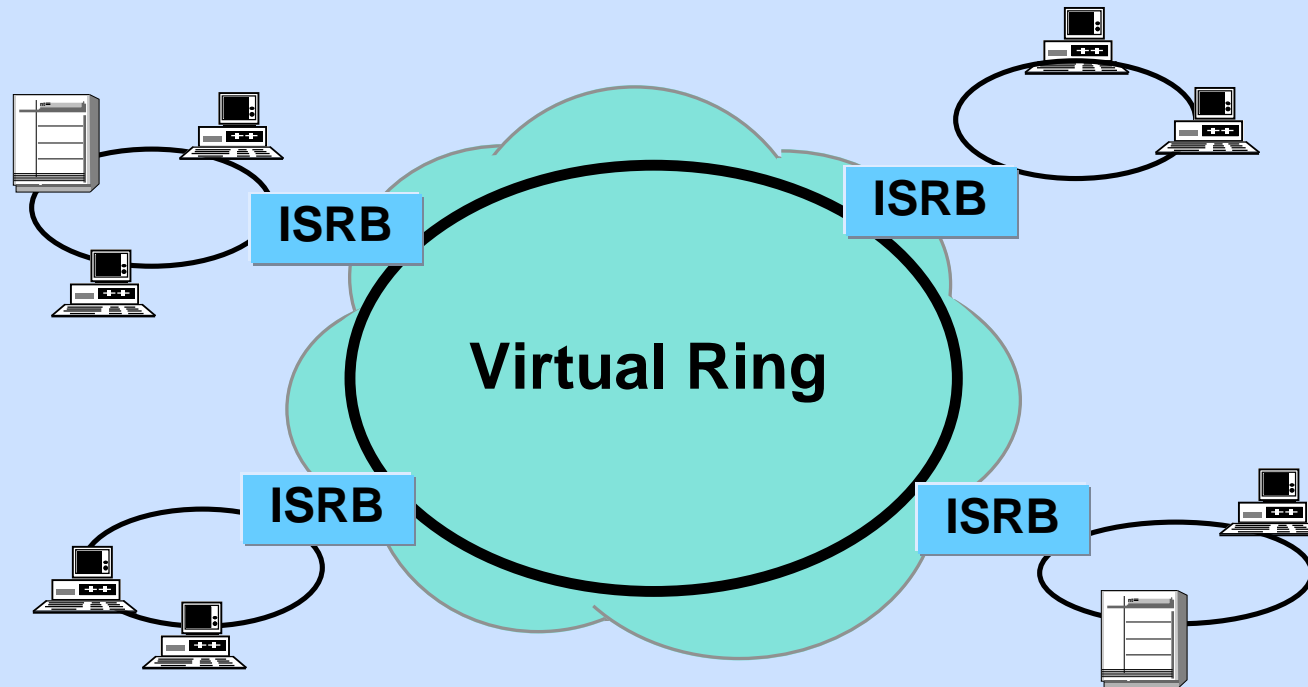

Senior Network Engineer
otglp01@nt.com

Agenda

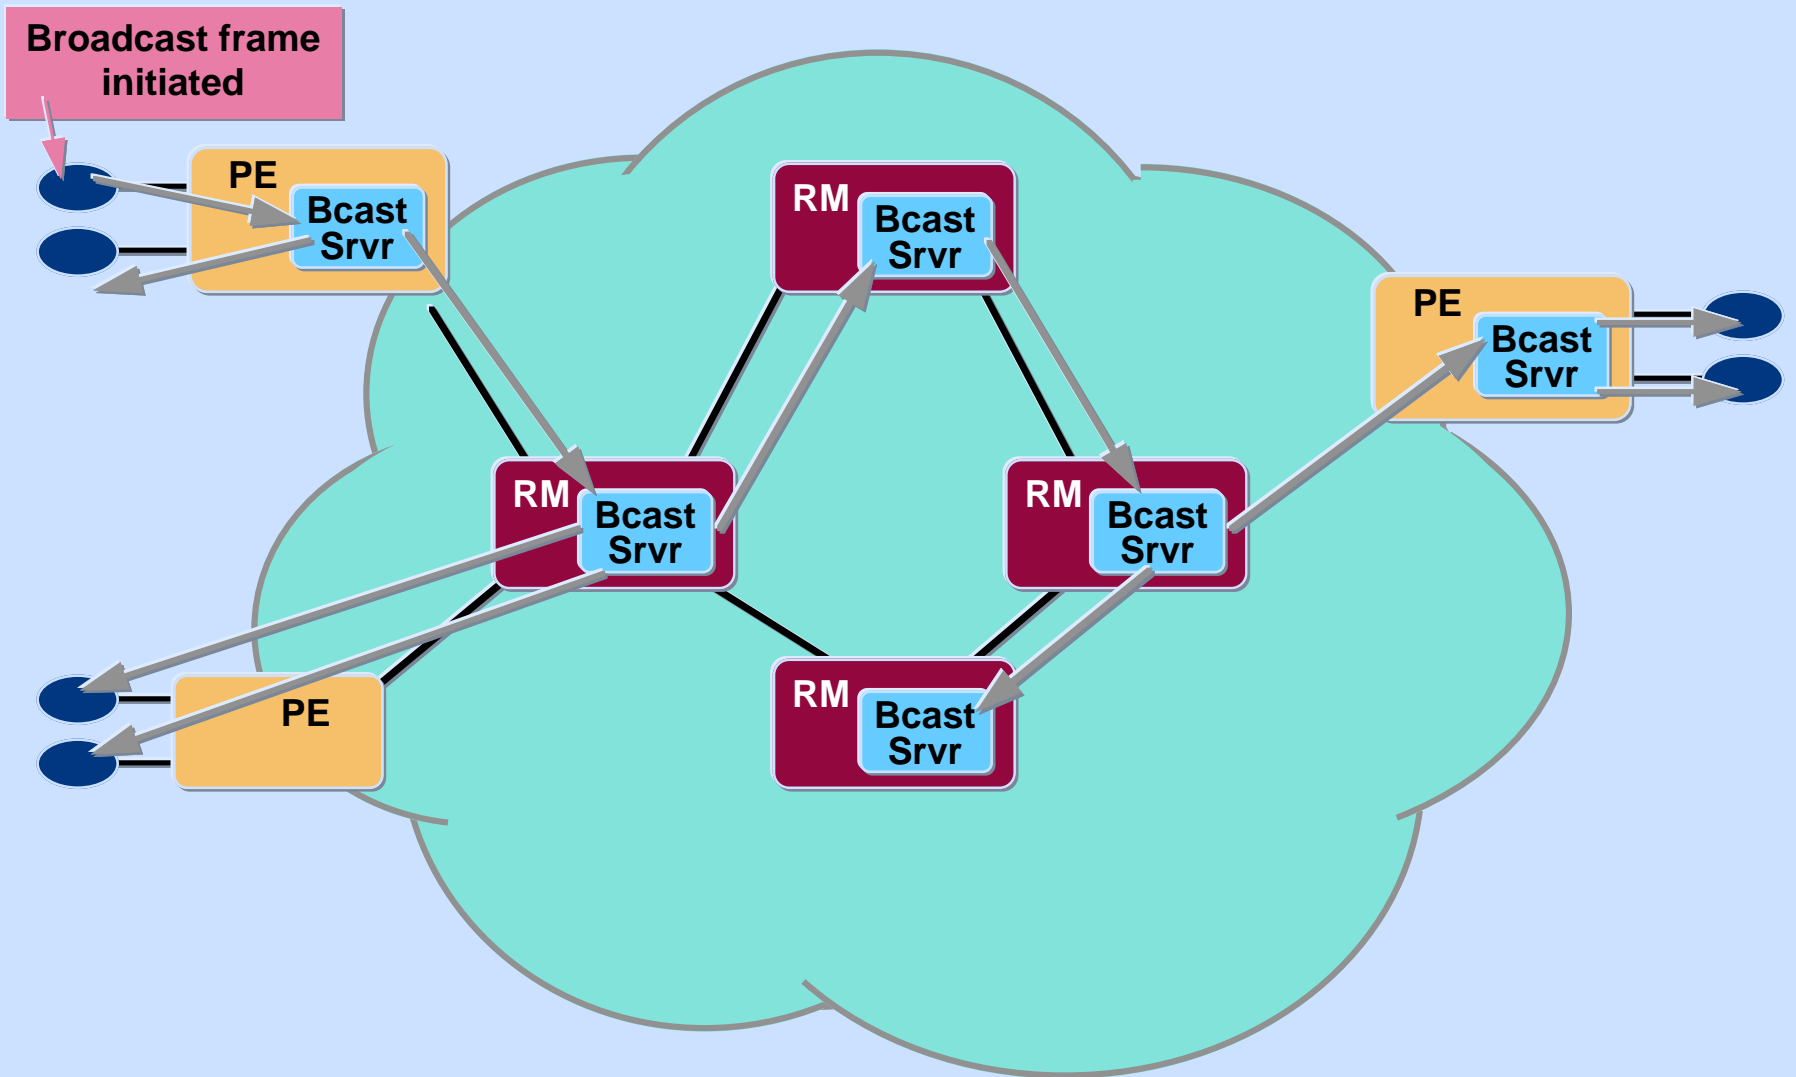

- **ISRB Overview**
- Engineering Constraints
- Broadcast Traffic Sources
- Network Topology Considerations
- LanCalc Tool
- Interworking with Routers

ISRB Overview

- **Reduced broadcast overheads**
- **Exploit DPN intelligent routing**
- **WAN topology transparent to end users**
- **Supports source routing compatible applications**

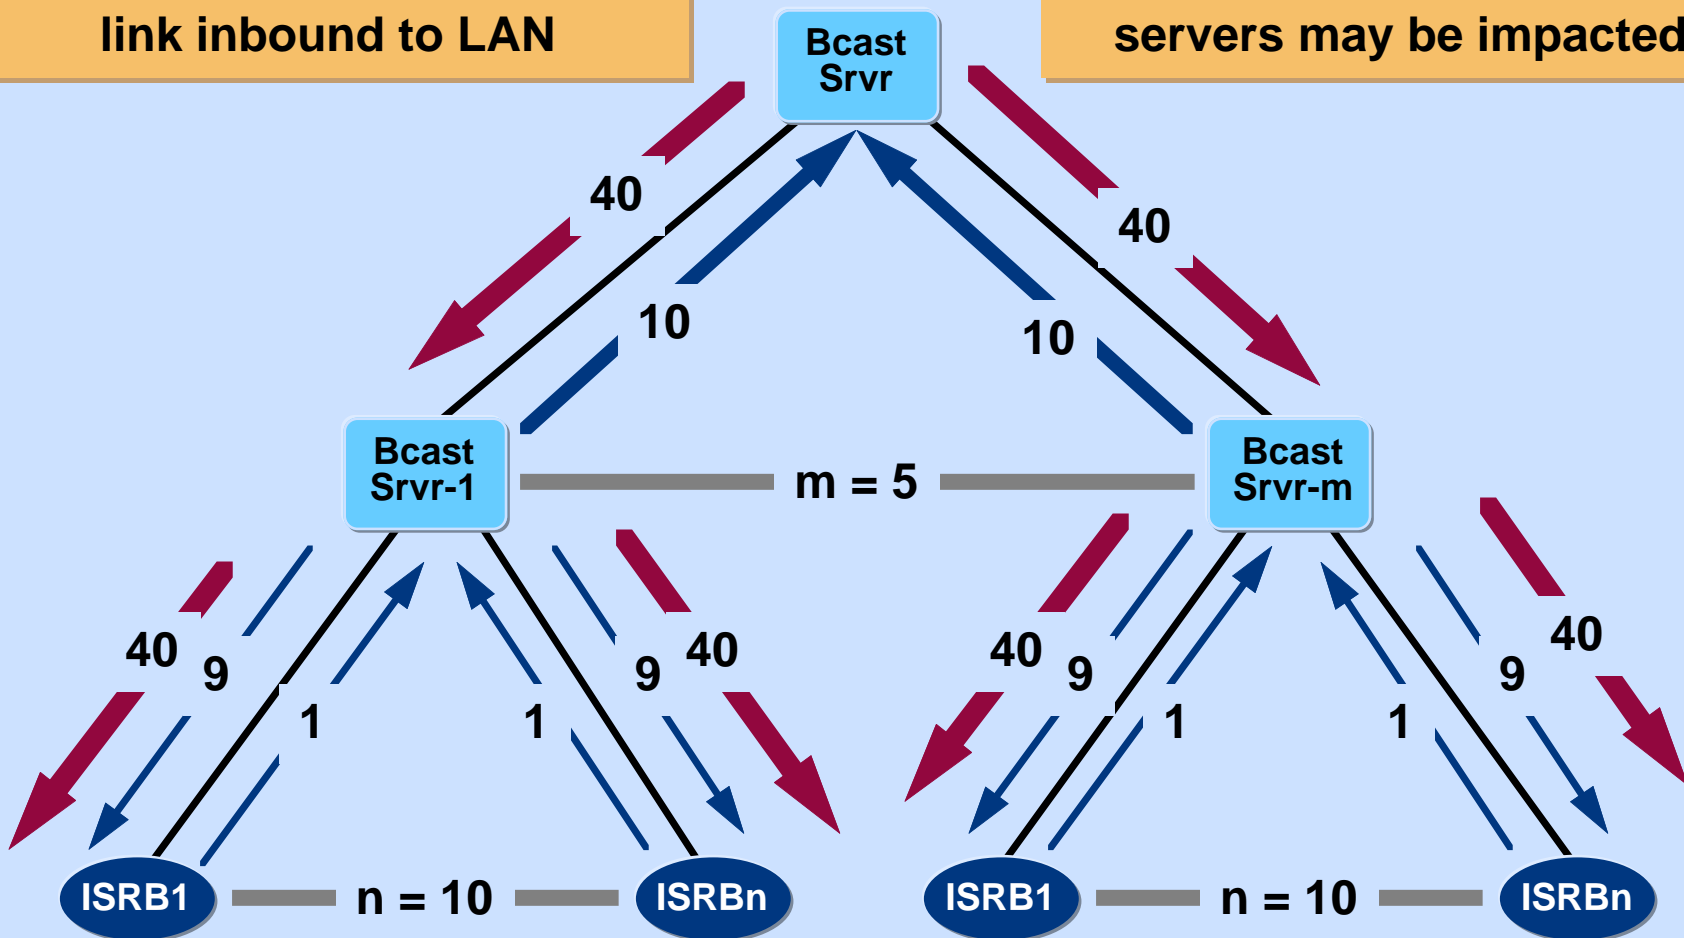

ISRB Broadcast Data Flows

Broadcast Traffic Distribution

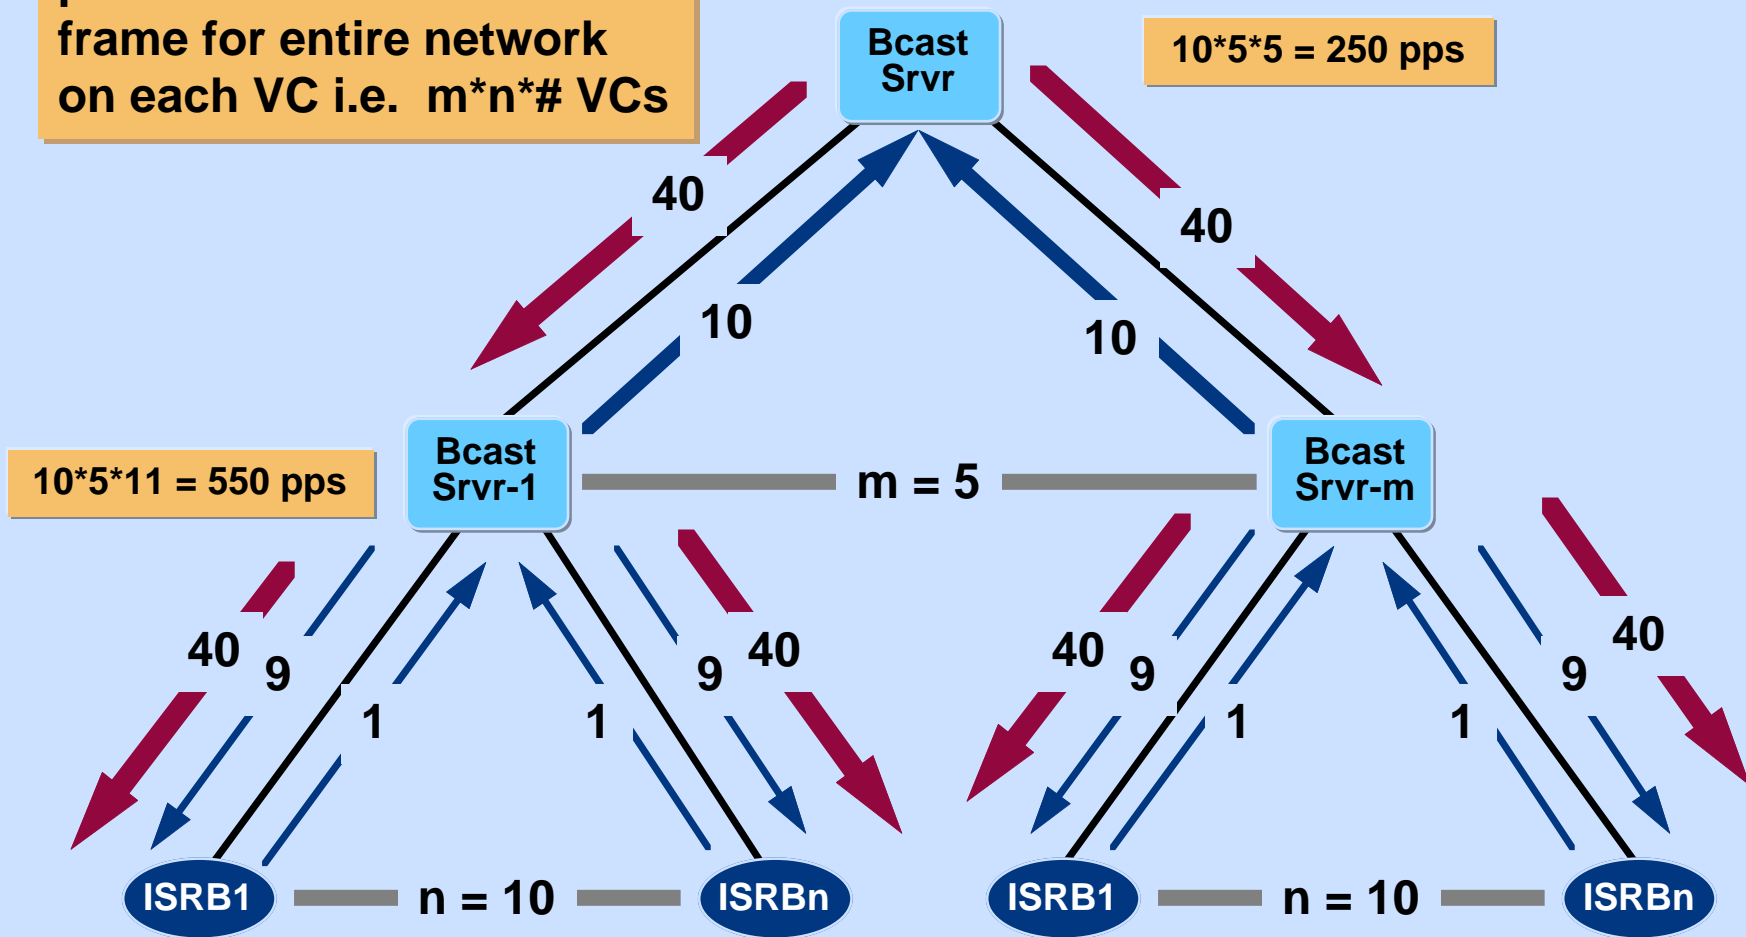

Broadcast traffic dominates link inbound to LAN

Data retrieval from remote servers may be impacted

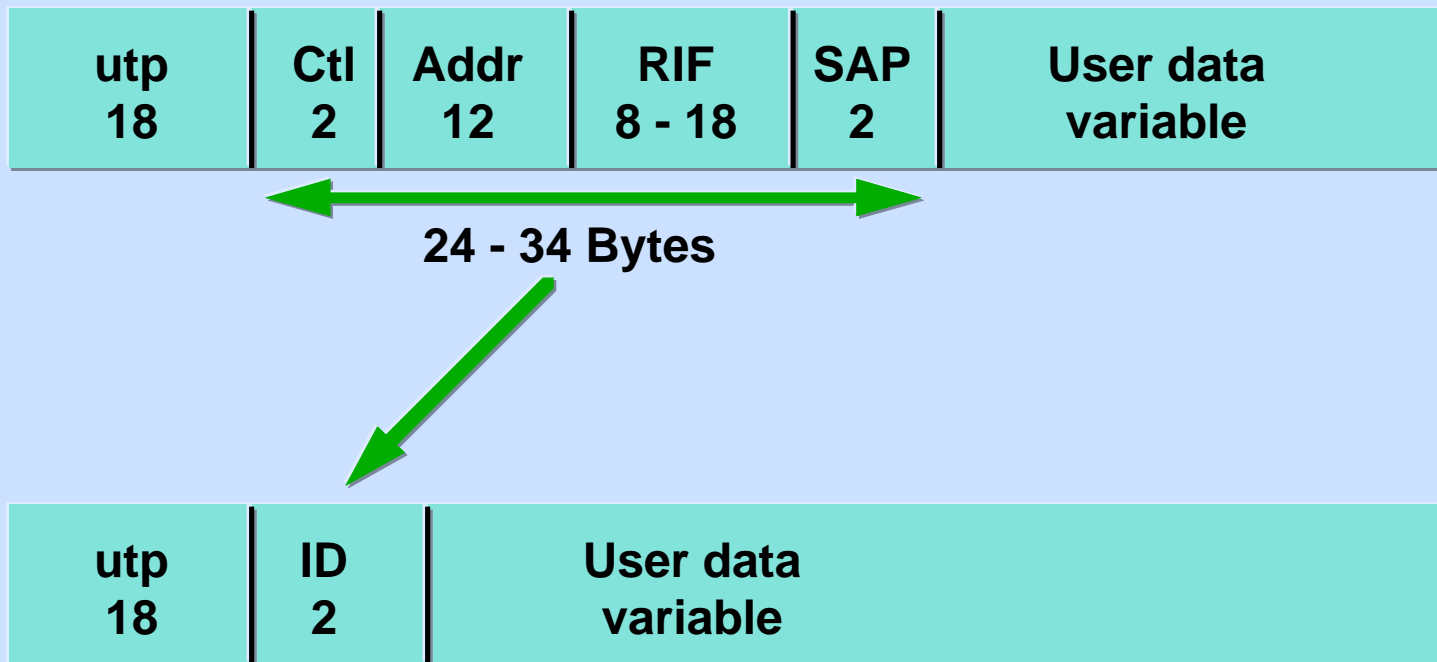

Broadcast Server PE Utilization

Each broadcast server processes each broadcast frame for entire network on each VC i.e. $m \cdot n \cdot \# \text{ VCs}$

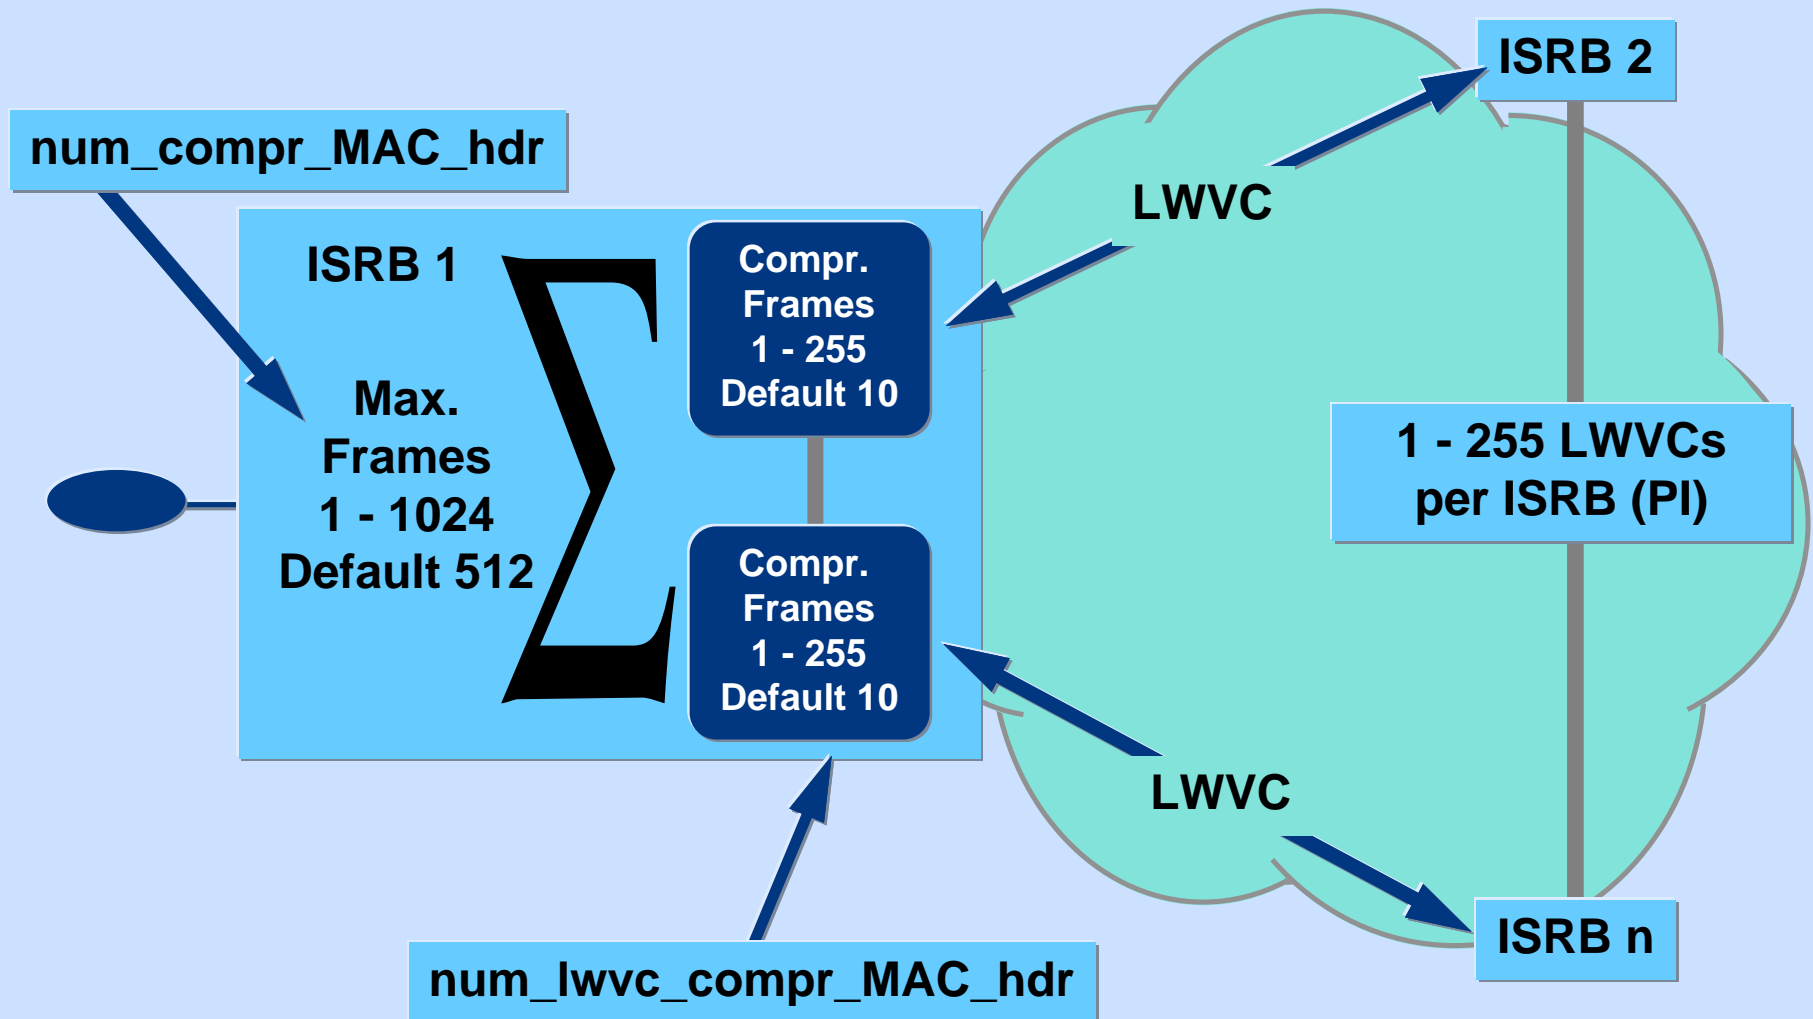

MAC Header Compression

Significant savings, particularly for short frames such as keep alive frames

MAC Header Compression Tables

MAC Header Compression Benefit

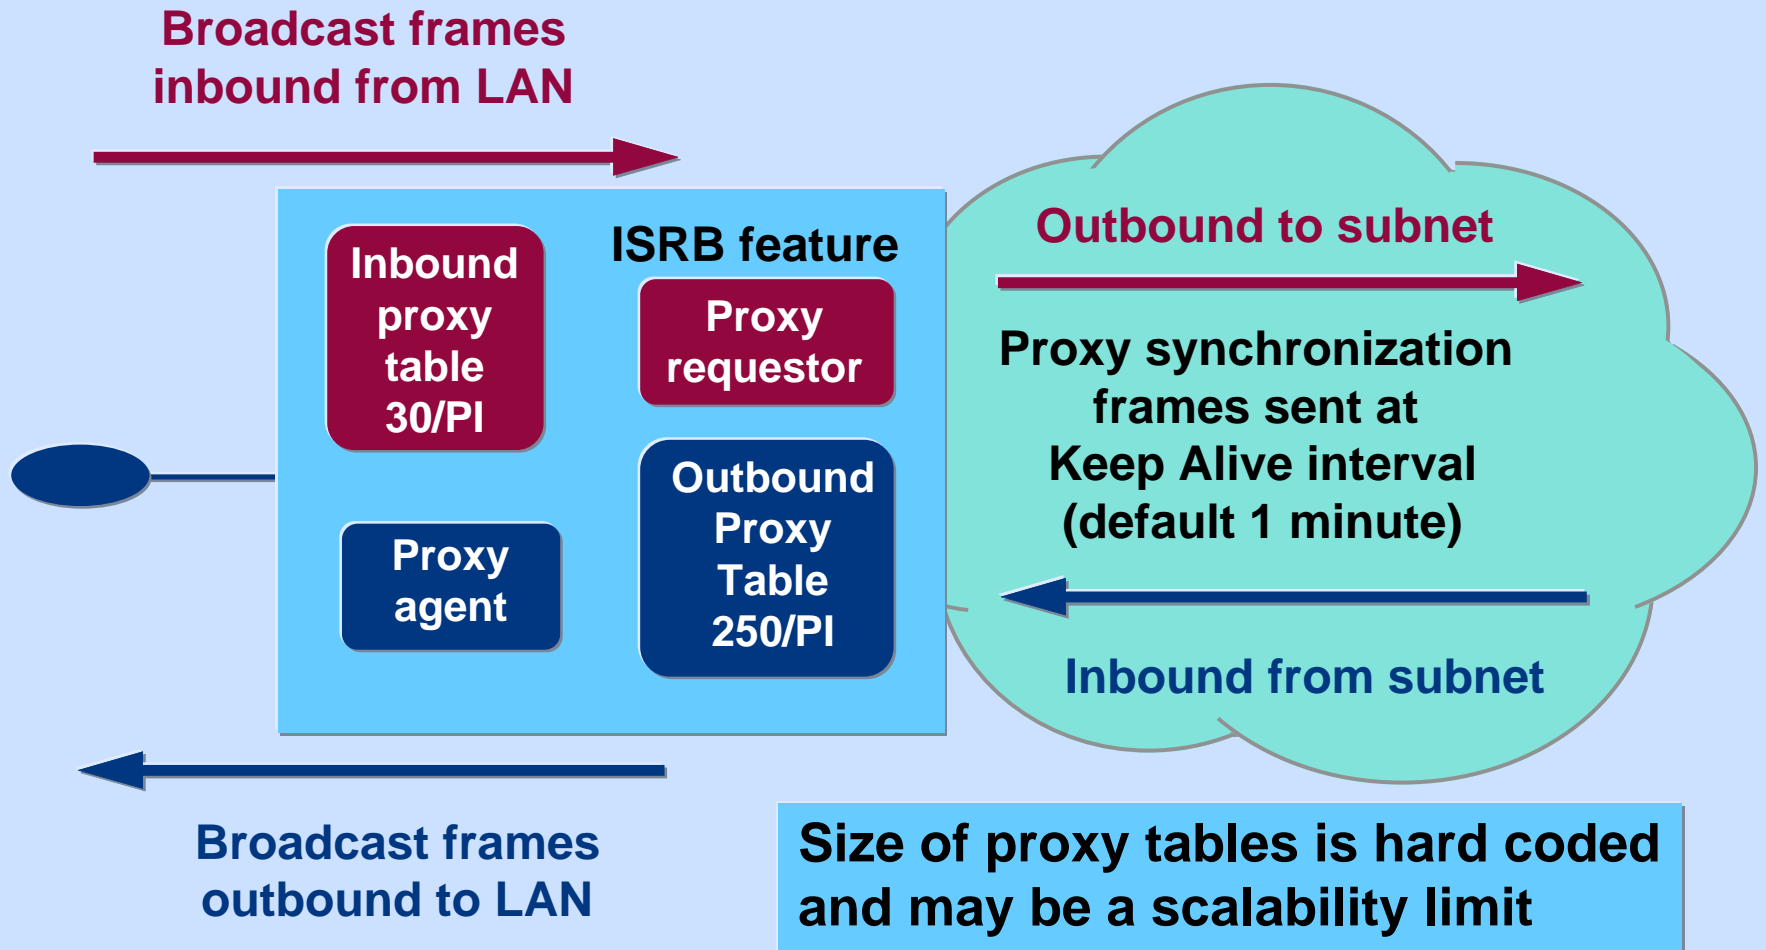

Transaction Description	Protocol ID	Options		Kbps Traffic		PE Utilization %			Link Util %	
		MHC	Proxy	In	Out	ISRB Access	Bcast Server	Total Acc + Server	In	Out
20/50 bytes										
	TCP Interactive	N	N	2.9	2.5	0.6%	0.0%	0.6%	29.7%	25.6%
	TCP Interactive	Y	N	2.3	1.9	0.5%	0.0%	0.5%	23.6%	19.4%
100/1000 bytes										
	TCP Interactive	N	N	3.5	1.1	0.3%	0.0%	0.3%	36.9%	11.9%
	TCP Interactive	Y	N	3.3	0.9	0.3%	0.0%	0.3%	34.4%	9.4%

Approx 20% Savings

Approx 7% Savings

Compression savings greatest for small frames such as LLC2 Keep Alive frames; approximately 83%

Proxy Broadcast Server

Proxy Eligible Frames

- **Novell Netware RIP (Routing Information Protocol)**
- **Novell Netware SAP (Service Advertisement Protocol)**
- **IBM LanServer \MAILSLOT\NET\NETLOGON**
- **IBM LanServer \MAILSLOT\LANMAN**
- **Netbios Name Query *****

Note: Other RIP frames such as IP RIP are NOT proxy eligible in current ISRB implementation

Proxy Synchronization Frames

- UTP header of 18 bytes
- Proxy broadcast header is 22 bytes
- Each proxiable frame is represented by a 3 byte frame correlator
- Maximum size of frame (excluding utp header) is limited to packet size defined between ISRB and broadcast server
- Proxy Requestor limited to 30 frames in Inbound table
- Maximum frame size = $18 + 22 + (30 \times 3) = 130$ bytes

Proxy Broadcast Savings

Protocol ID	Options		Kbps Traffic Summary				Cumulative Frame Counts				PE Utilization %			Link Util %	
	MHC	Proxy	Specific Route		Broadcast		Proxied		MHC		ISRB	Bcast	Total	In	Out
			In	Out	In	Out	In	Out	Total	perVC	Access	Server	Acc + Server		
Novell SAP	N	N	0.0	0.0	10.4	0.1	0	0	0	0	0.6%	11.8%	12.4%	18.6%	0.1%
Novell SAP	N	Y	0.0	0.0	1.2	0.0	1	200	0	0	0.2%	9.4%	9.6%	2.2%	0.0%
Proxy Server savings											61.7%	20.3%	22.2%	88.2%	90.5%

Significant savings from use of Proxy Server for example:

Access PE	60%
Server PE	20%
Access Link	90%

Agenda

- ISRB Overview
- **Engineering Constraints**
- Broadcast Traffic Sources
- Network Topology Considerations
- LanCalc Tool
- Interworking with Routers

Engineering Constraints

- **Multiple possible constraints**
 - network link bandwidth
 - access PE utilization
 - broadcast server PE utilization
 - Proxy Table sizes
 - MAC Header Compression Table sizes
- **Weakest link determines scalability limit**

1. **Establish criteria for each potential constraint**
2. **Use LanCalc Tool to evaluate each resource**
3. **Determine scalability based on limiting constraint**
4. **Each network and application is unique**

Network Link Utilization

- **Function of network size, number of devices, application protocols, frame sizes, and ISRB options**
- **Separate criteria for broadcast traffic and specifically routed traffic**
- **Protocols such as TCP and SPX burst mode use all available bandwidth**
- **Slowest speed network link normally the limiting constraint**

Need a methodology to establish maximum allowable broadcast traffic

Broadcast Traffic Limitation

- **Constrain broadcast traffic to lowest priority of DPN 4 Q mechanism**
- **Determine percentage share of network link for each priority level**
 - function of average frame size for each level
 - evaluate statistics to determine average frame sizes
 - use LanCalc tool to determine percentage share
- **Determine percentage to allow for broadcast**
- **Consider other features sharing Broadcast Server**
 - T2.1 Router; ITI, or X.25 Broadcast

Broadcast Traffic Limit Example

The screenshot shows a dialog box titled "Define Average Frame Sizes". It contains a table with columns for "Select Broadcast Prio", "Frmsz", and "Util %". The "Specify Util % Value" option is selected. Arrows from labels on the left point to the radio buttons: "SNA traffic" points to "1 High, Delay", "ISRB traffic" points to "3 Normal, Delay", and "Broadcast traffic" points to "Specify Util % Value".

Select Broadcast Prio	Frmsz	Util %
<input type="radio"/> 1 High, Delay	128	20.7
<input type="radio"/> 2 High, Thruput	256	27.6
<input type="radio"/> 3 Normal, Delay	256	27.6
<input type="radio"/> 4 Normal, Thruput	450	24.2
<input checked="" type="radio"/> Specify Util % Value		10.0

Enter average frame sizes for each of the four DPN priority levels; These will be used to calculate the minimum guaranteed share of link bandwidth based on the DPN quota priority mechanism.

- Each network will be different
- Exploit DPN prioritization mechanism

PE Type and Broadcast Server

- **Use of Broadcast Server on a MAS is a double edged sword**
 - netlink utilization will be reduced
 - broadcast server must process all broadcast frames, and may consume too much of PE utilization, becoming the weakest link
- **Only applies if there are multiple ISRB capable PIs on the MAS, or downstream MAS-based nodes in a cascaded configuration**

LanCalc tool makes it easy to examine this tradeoff

Agenda

- ISRB Overview
- Engineering Constraints
- **Broadcast Traffic Sources**
- Network Topology Considerations
- LanCalc Tool
- Interworking with Routers

Novell Netware Broadcast Sources

- **SAP (Service Advertising Protocol)**
 - broadcast every 60 seconds by every server
 - frame size a function of number of services
- **RIP (Routing Information Protocol)**
 - broadcast every 60 seconds by every IPX router
 - frame size a function of topology of network
- **Service query**
 - broadcast by every Novell user station to locate nearest servers
 - use Sniffer to determine relevant frequency

Netware Frame sizes

SAP	utp 18	Hdr 22/18	IPX 30	Service 1 64	_____	Service 7 64

RIP	utp 18	Hdr 22/18	IPX 30	Hdr 2	Ntwk 1 8	_____	Ntwk 50 8

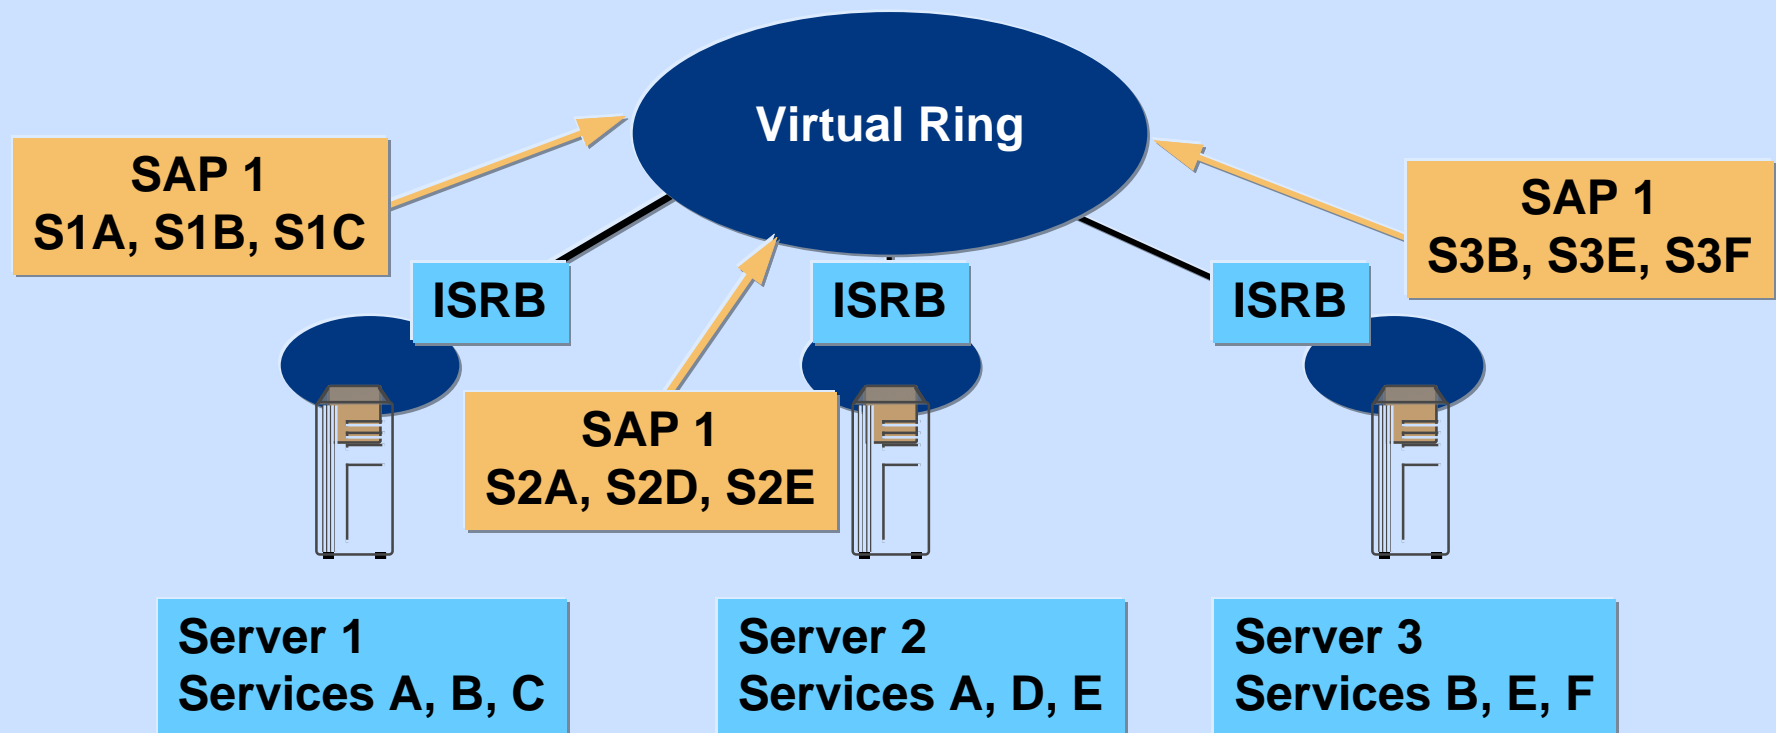

Nearest service:

Query	utp 18	Hdr 18	IPX 30	Request 4

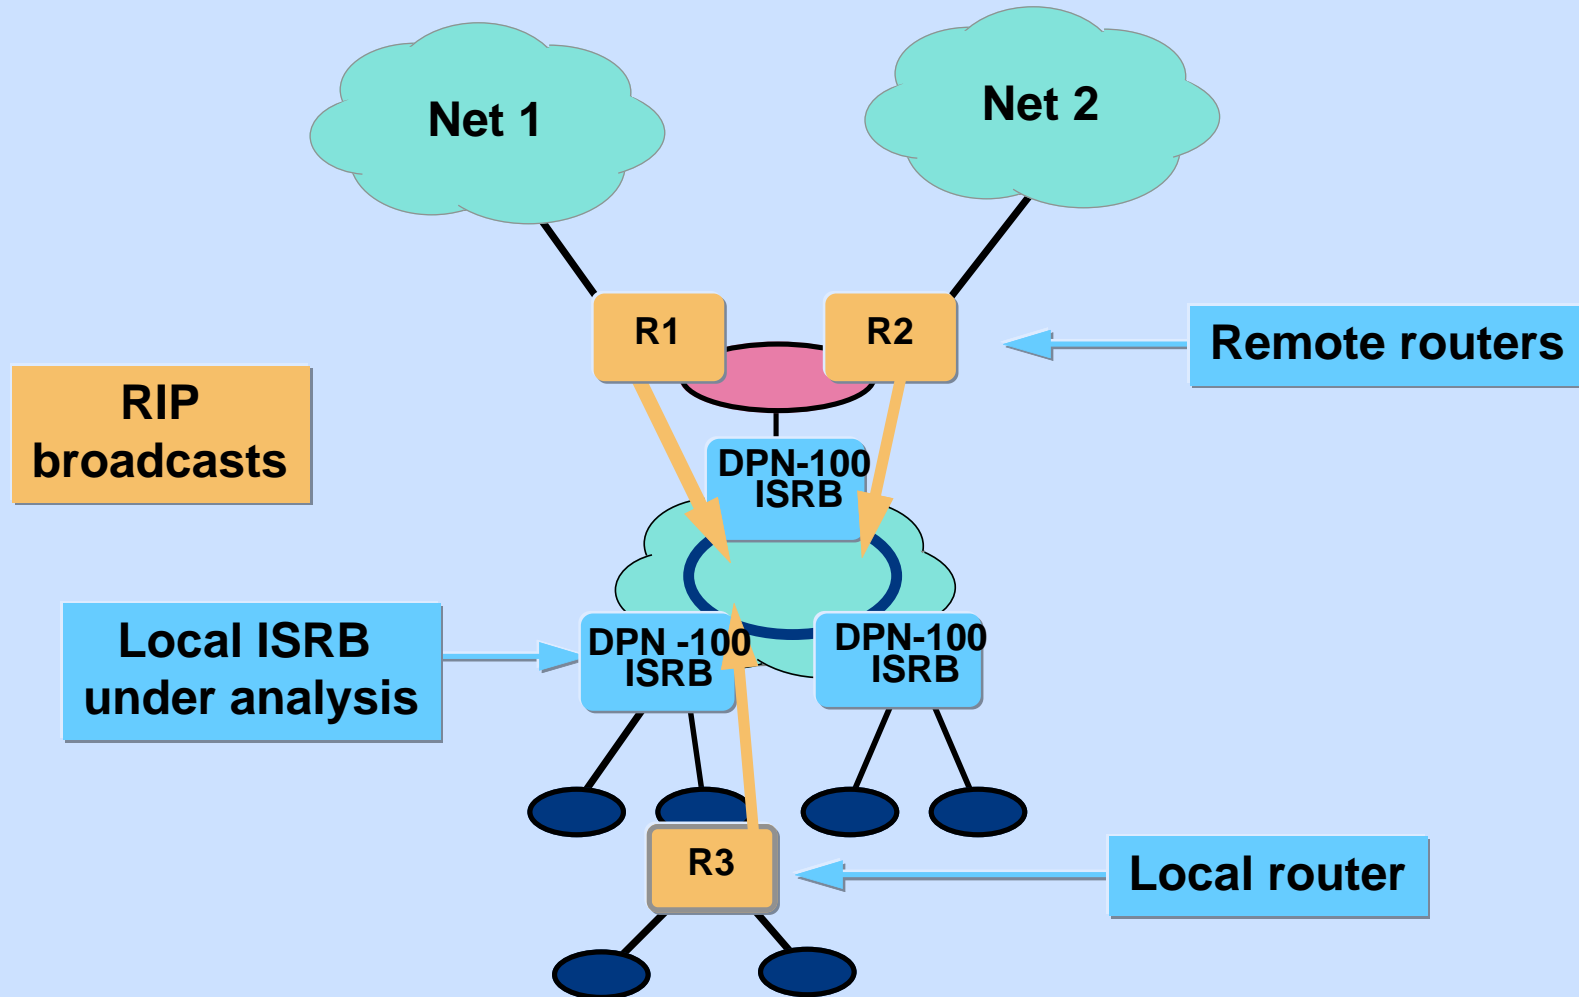

Resp	utp 18	MAC hdr 2/24	IPX 30	Resp 64	Response from ALL servers providing service

SPX	utp 18	MAC hdr 2/24	IPX 30	SPX 42	NCP Hdr 6/8	User Data Var

Netware SAP Detail

RIP Overview

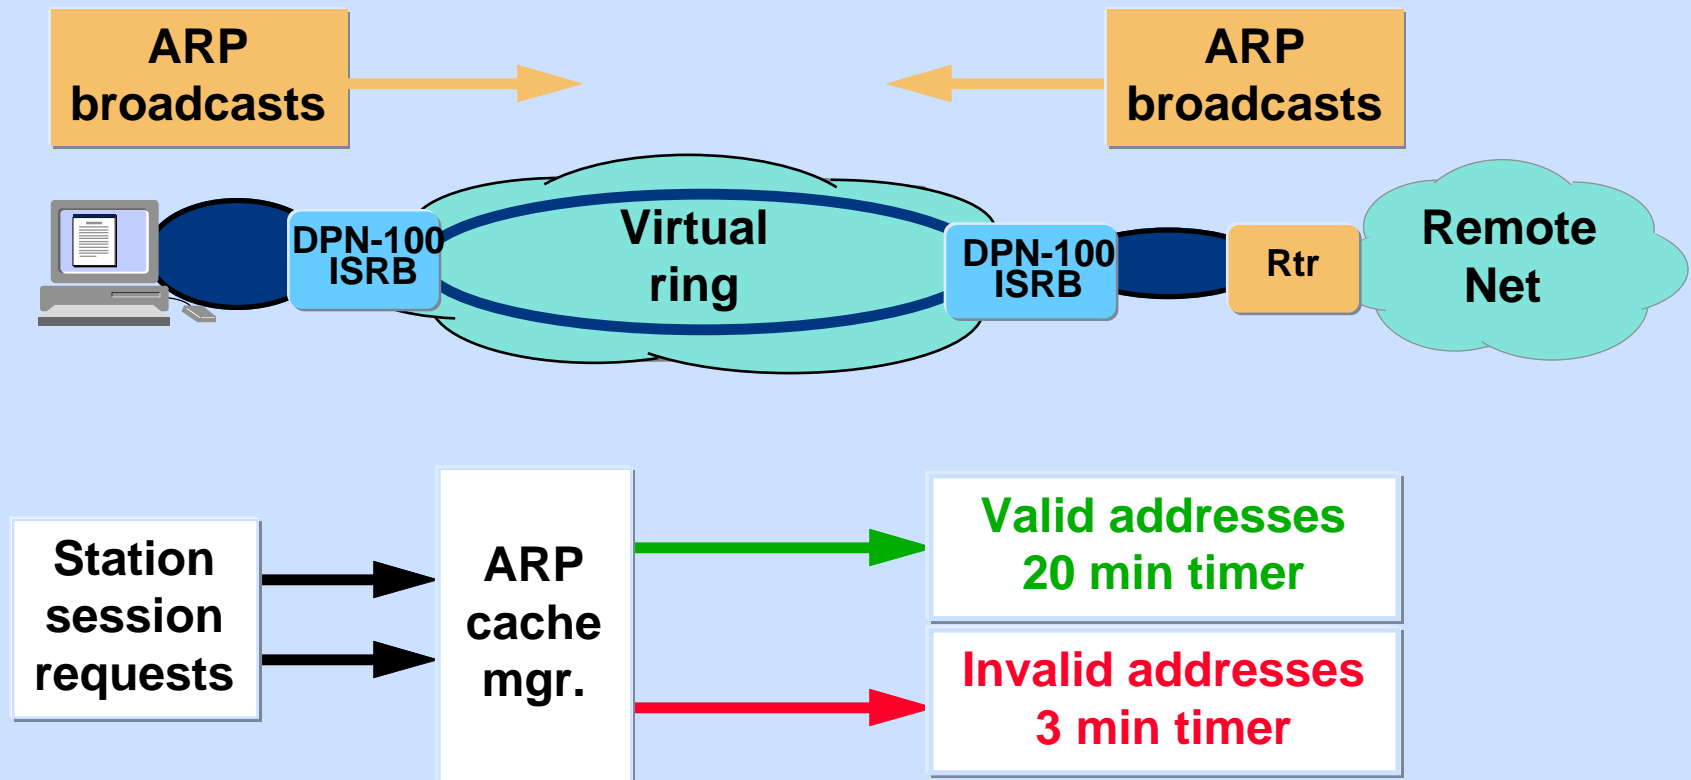

IP Broadcast Sources

- **RIP (Routing Information Protocol)**
 - broadcast by every router every 30 seconds
 - frame size a function of network topology
- **IP ARP (Address Resolution Protocol)**
 - broadcast by individual stations to determine MAC address associated with a given IP addr
 - frequency a function of appl'n characteristics
 - use Sniffer to determine frequency
- **IP RARP (Reverse Address Resolution Protocol)**
 - used by diskless workstations to locate their server
 - potential source of broadcast storms

TCP/IP Frame Sizes

ARP Overview

Telnet and Rlogin Overview

Character Mode:

1 byte packets

Line Mode:

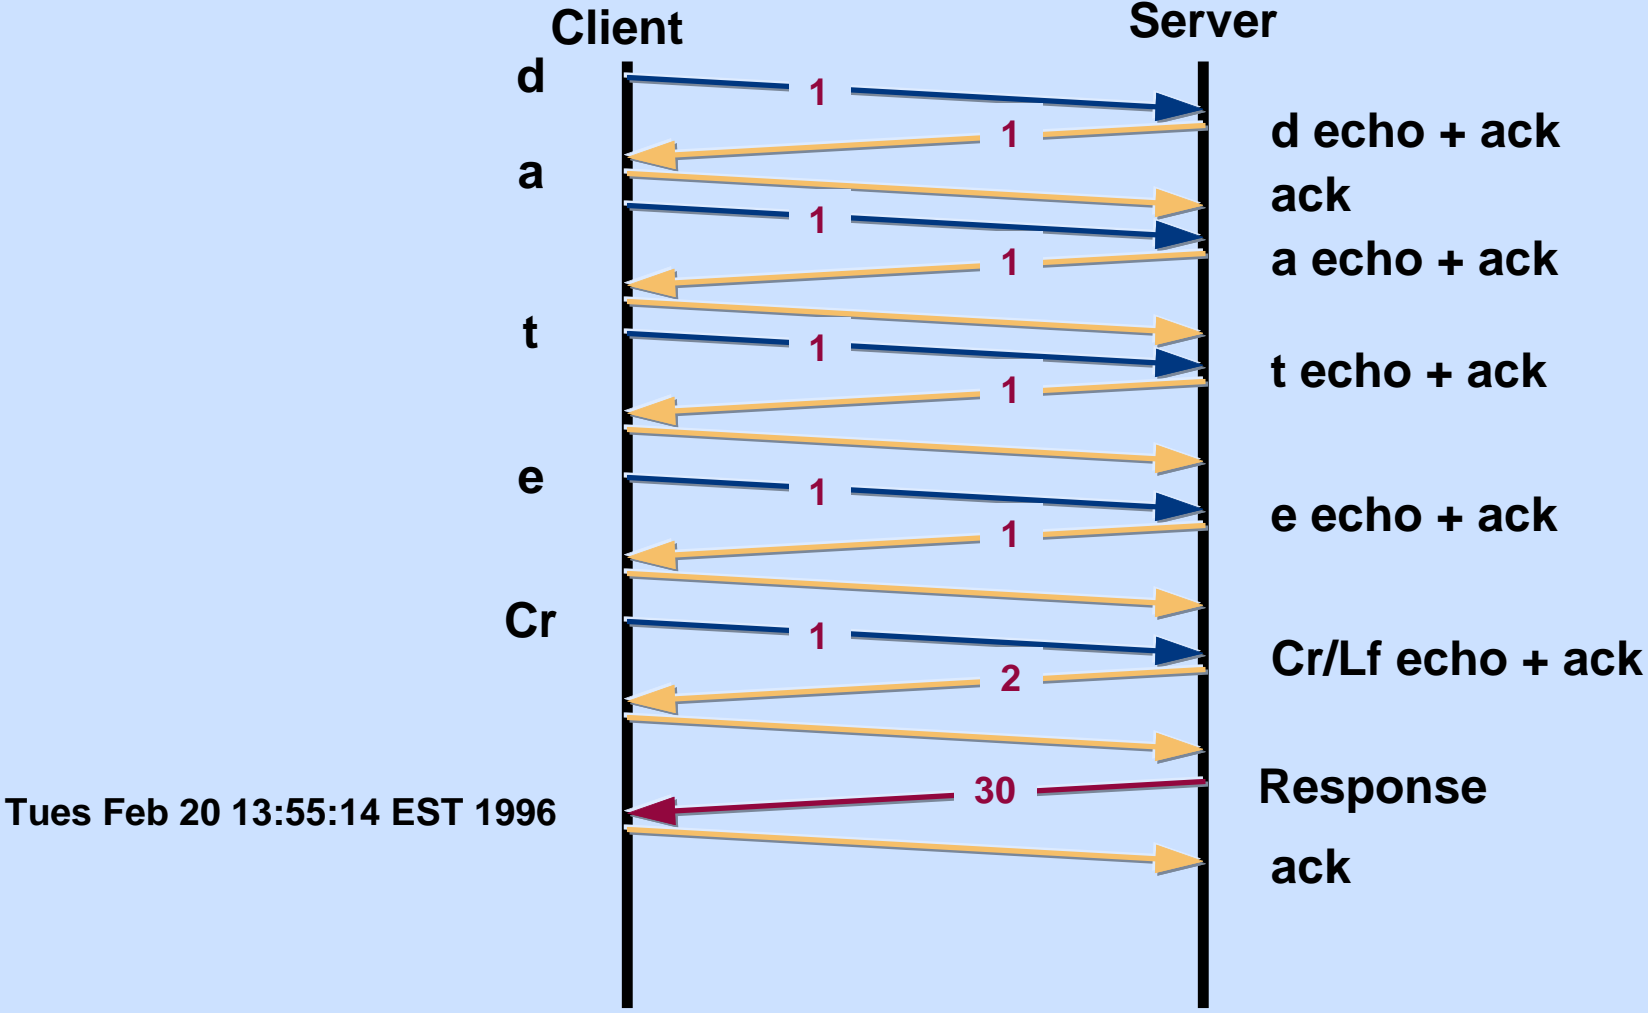

Multi byte packets

Nagle Algorithm:

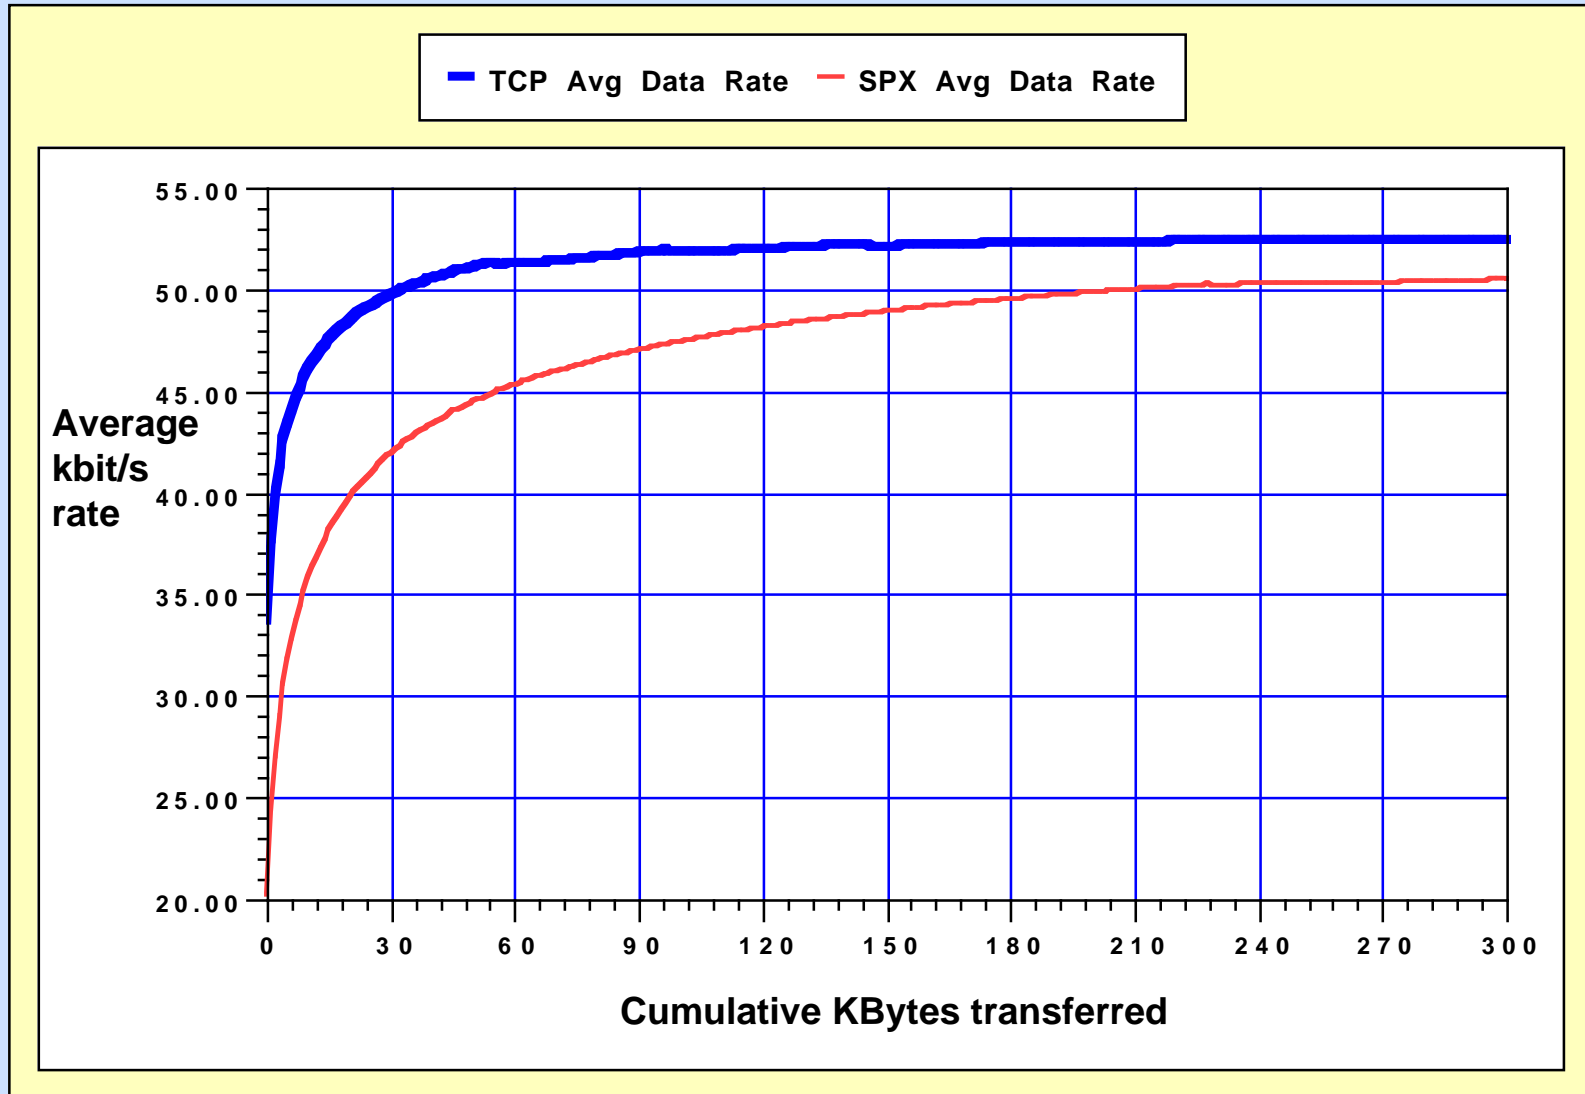

Buffers characters as a function of round trip time. Reduces negative impact of Character Mode operation.

Use Sniffer to determine average packet size

Telnet Character Mode

TCP and Novell File Transfer

Agenda

- ISRB Overview
- Engineering Constraints
- Broadcast Traffic Sources
- **Network Topology Considerations**
- LanCalc Tool
- Interworking with Routers

Broadcast Server Topologies 1

Single central server

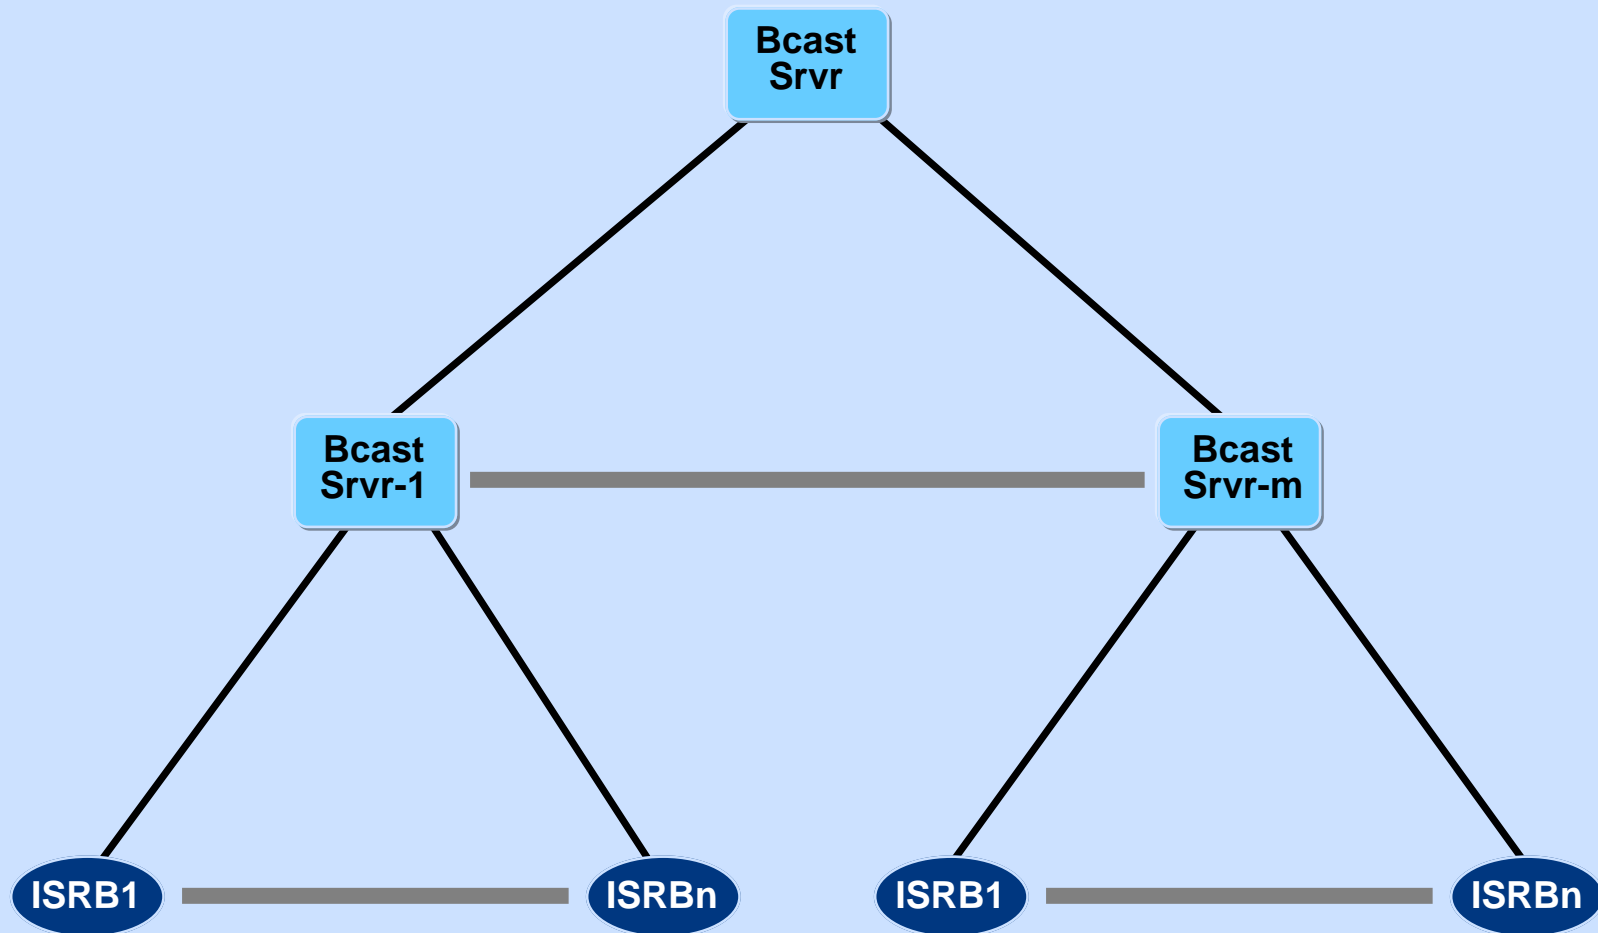

Multi-server broken ring

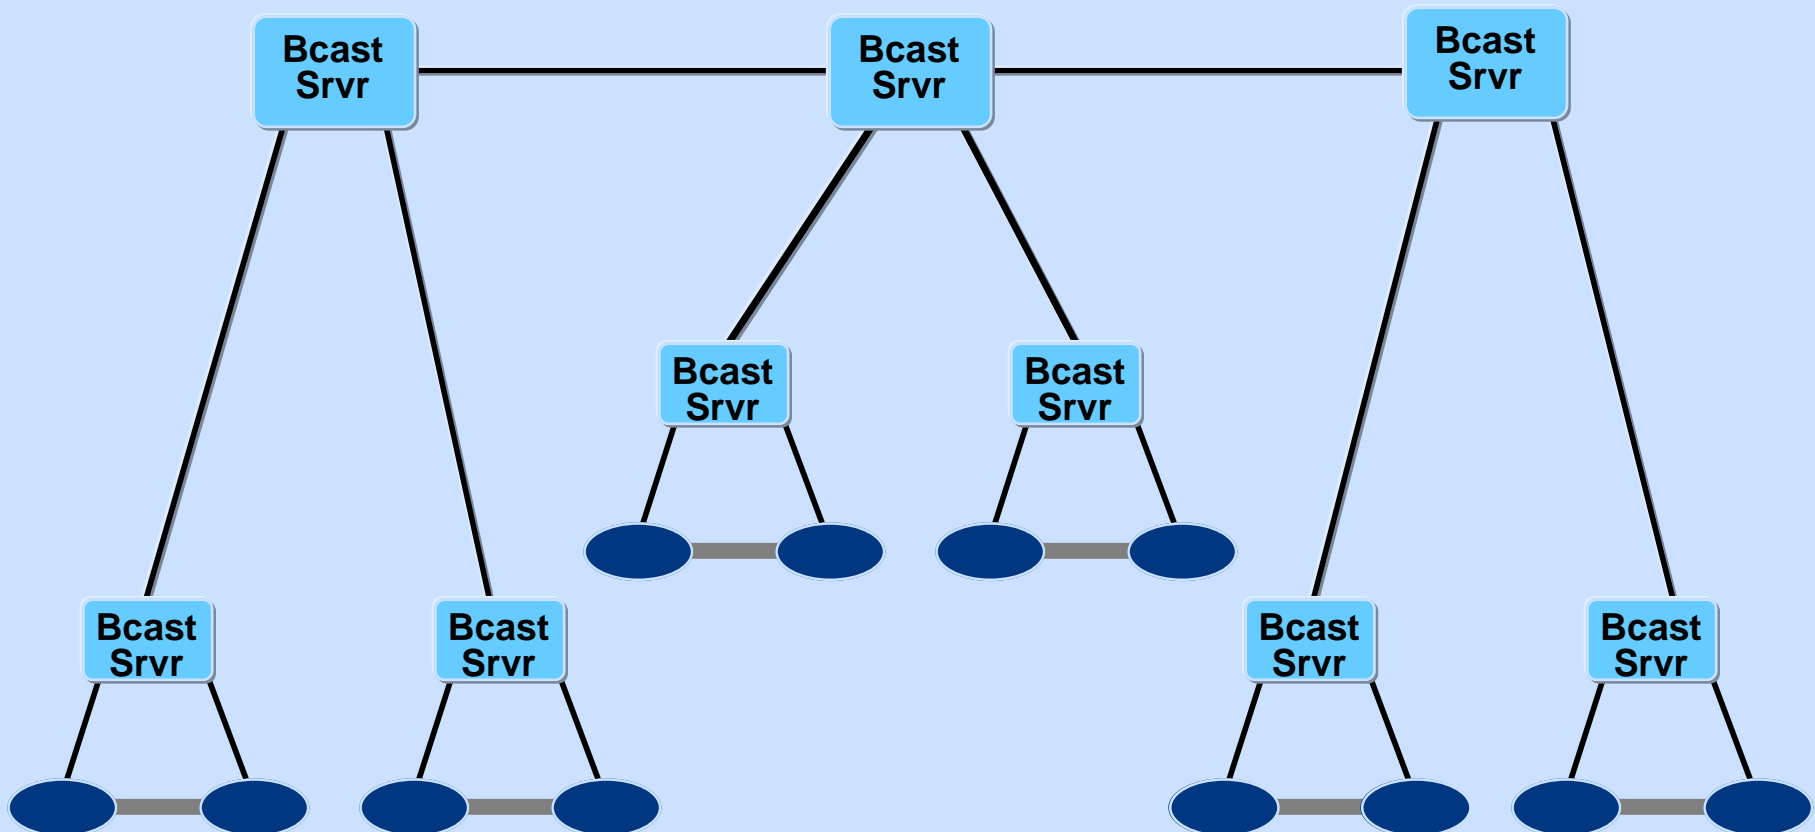

Broadcast Server Topologies 2

Hierarchical server topology

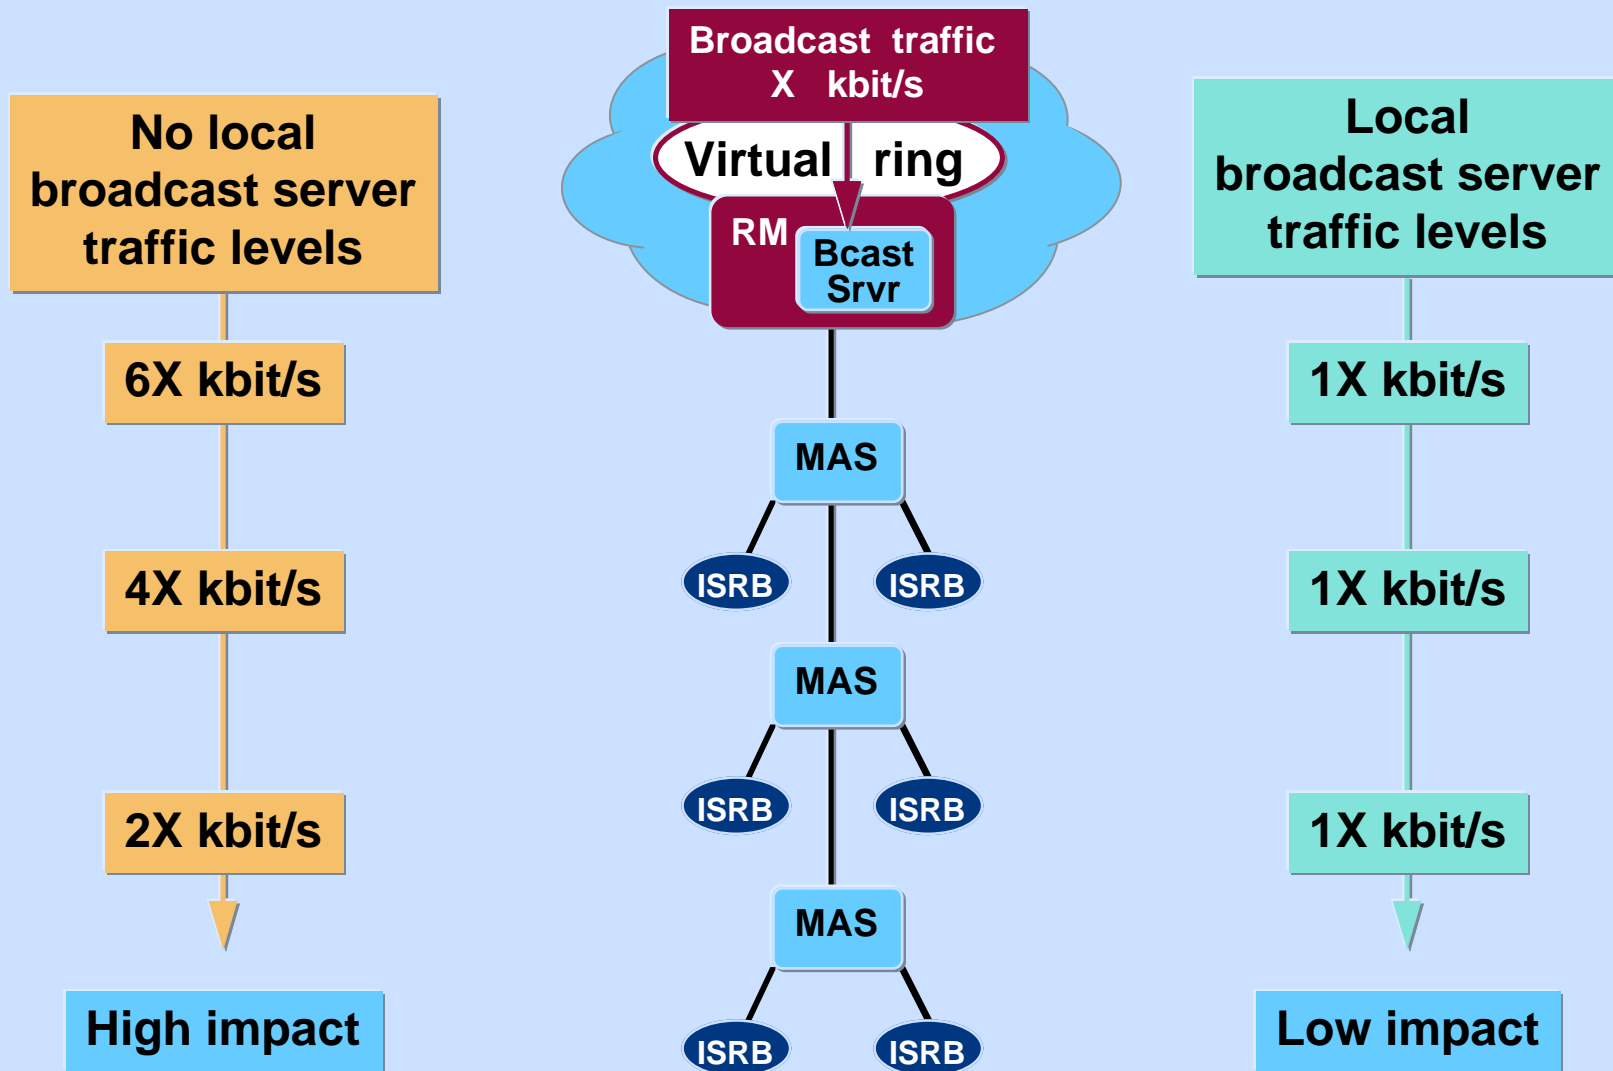

Broadcast Server Topologies 3

Hierarchical multi-server broken ring

Tandem Server Considerations

Agenda

- ISRB Overview
- Engineering Constraints
- Broadcast Traffic Sources
- Network Topology Considerations
- **LanCalc Tool**
- Interworking with Routers

LanCalc Overview

- **Wingz spreadsheet-based tool available for PC, MAC, and Unix platforms**
- **Dialog boxes for all data entry**
- **Context sensitive help**
- **Table driven to make extensions easy and permit key parameters to be changed**
- **Detailed error log for parameters and inputs out of range**
- **All logic coded in Hyperscript to prevent inadvertent change and speed execution**

Wingz available from IISC worldwide

LanCalc Menu Dialogs

Custom	
Fast Calc	⌘I
Input Data	⌘`
Help	⌘H
Print/Preview/Goto	⌘P
Mtce Functions	⌘M

The Custom Menu item is used to:

- 1 Initiate calculations;
- 2 Navigate around the sheet (go to); or
- 3 Print selected reports.

LanCalc Global Access Dialog Box

Define Access Global Variables

PE Type	Link Kbps
AM 386	64
AM 486 HPPE	112
MAS 386 Intra	128
MAS 386 Transit	192
MAS HPPE; EPRPI; FR NL	256
MAS HPPE; EPRPI; UTP NL	320
MAS HPPE; SEL; UTP NL	384

Cancel
Help

LanCalc Global Server Dialog Box

Define Server Global Variables

PE Type

- AM HPPE
- AM 386**
- MAS 386
- MAS HPPE

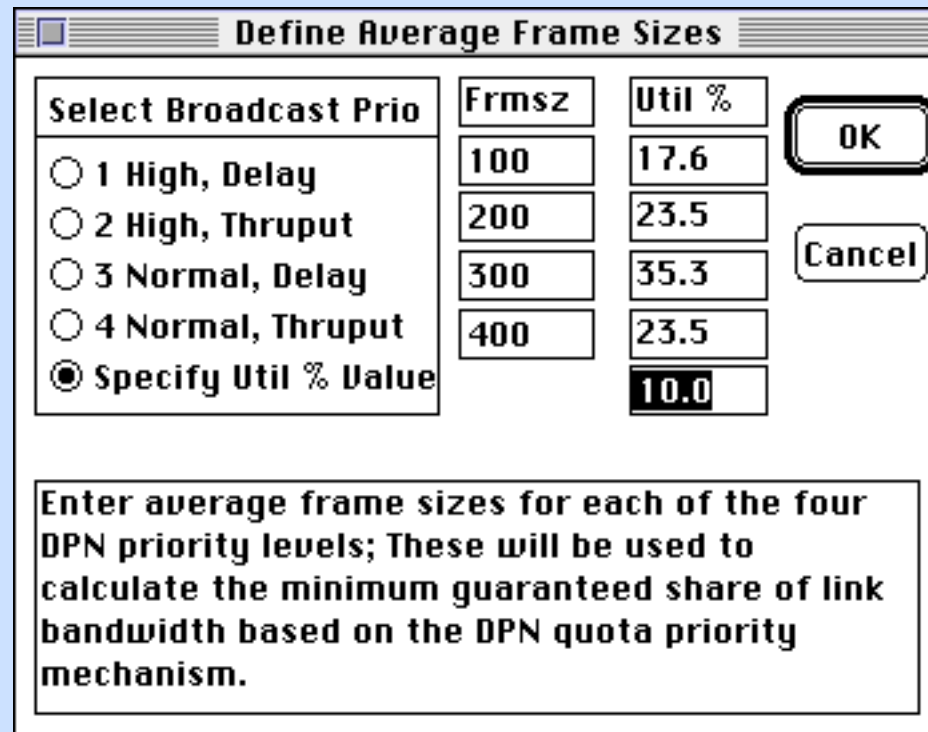

Max # server DCs: 10

Proxy Freq (min): 1

MTU Frame Size: 512

MTU (Maximum Transfer Unit) is the frame size used by LAN devices including routers, servers, and individual stations. Should be equal to Subnet Packet size for optimal efficiency

LanCalc Global Link Dialog Box

Select Broadcast Prio	Frmsz	Util %
<input type="radio"/> 1 High, Delay	100	17.6
<input type="radio"/> 2 High, Thruput	200	23.5
<input type="radio"/> 3 Normal, Delay	300	35.3
<input type="radio"/> 4 Normal, Thruput	400	23.5
<input checked="" type="radio"/> Specify Util % Value		10.0

Enter average frame sizes for each of the four DPN priority levels; These will be used to calculate the minimum guaranteed share of link bandwidth based on the DPN quota priority mechanism.

LanCalc Protocol Dialog Box

Select Lan Protocol Features

Feature: Row:

Options: Proxy Agent

Parameter Name	Value	Dft
# Local Servers	<input type="text" value="1"/>	<input type="button" value="Dft"/>
# Local Services	<input type="text" value="6"/>	<input type="button" value="Dft"/>
# Rmt Servers	<input type="text" value="100"/>	<input type="button" value="Dft"/>
# Rmt Services	<input type="text" value="10"/>	<input type="button" value="Dft"/>

Help Information / Error Message

Average number of services advertised per Local server; Minimum value = 1, Max = 30, Default = 5.

Buttons: OK, Insert, Delete, Clear, Help, Cancel

Agenda

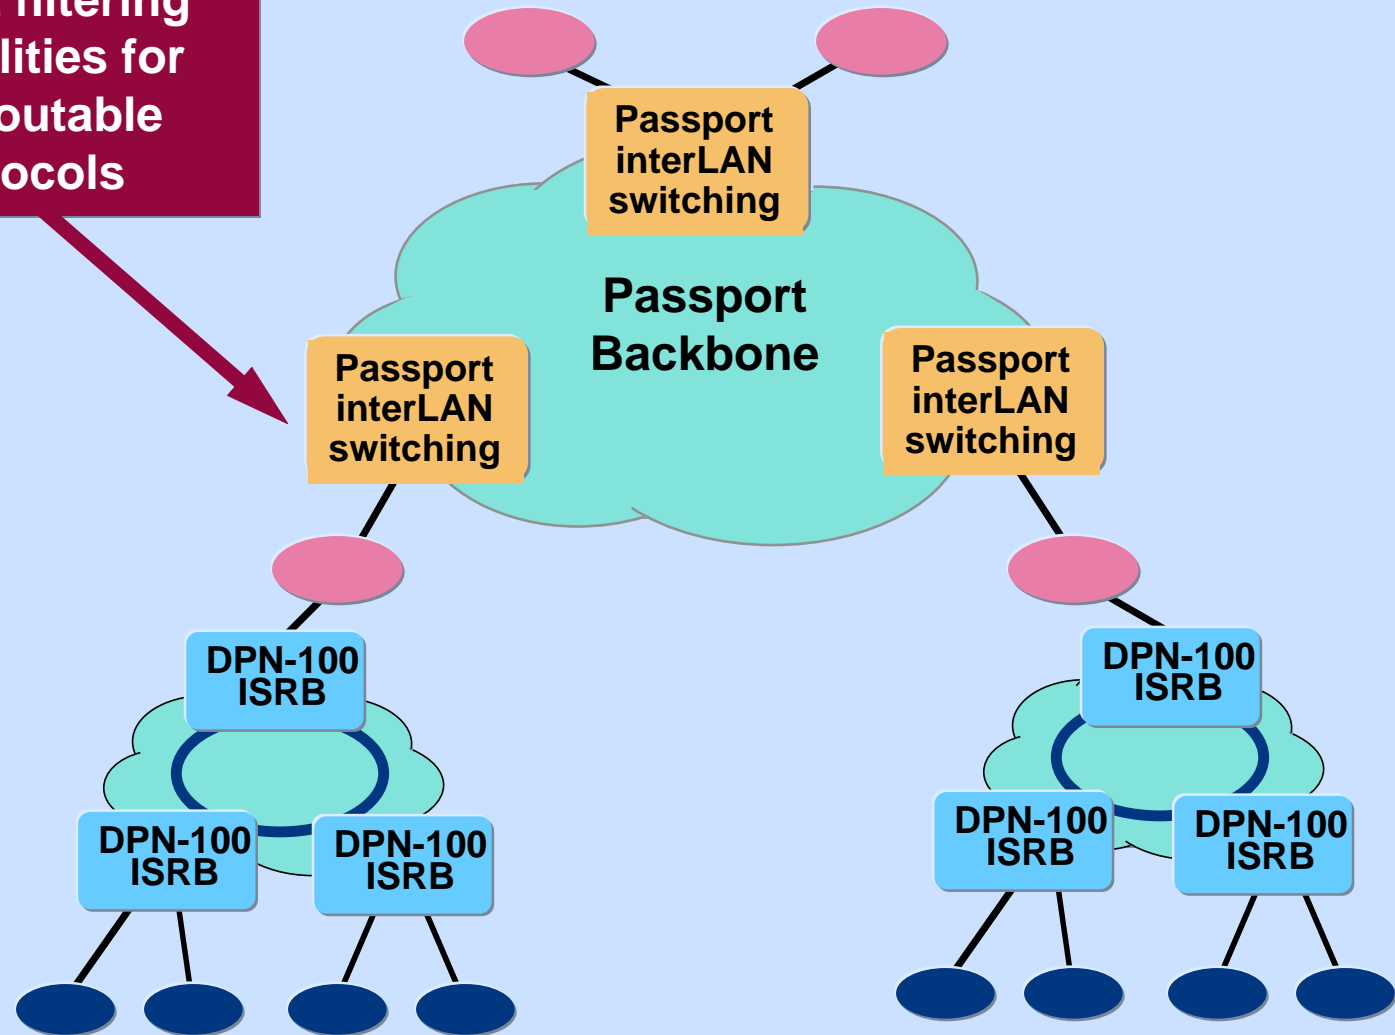

- ISRB Overview
- Engineering Constraints
- Broadcast Traffic Sources
- Network Topology Considerations
- LanCalc Tool
- **Interworking with Routers**

Interworking with Routers

- Familiar maxim: “*Bridge when you must, route when you can*”, still applies
- ISRB extends the application of bridging
- Magellan native LAN Routing can be exploited to extend overall solution
 - Passport interLAN switching
 - IP
 - Novell IPX
 - DPN-100 embedded router
 - IP, IPX, XNS, Decnet, AppleTalk, etc.
- External token ring gateway
 - can be stub ring
 - consider hop count constraints

Passport DPN-100 ISRB Interworking

Exploit filtering capabilities for non-routable protocols

Summary

- **Knowledge is the key**
 - LAN protocol suites
 - application characteristics
- **Use LanCalc to quantitatively assess alternative network designs**
- **Exploit native Magellan Passport routing**
 - upward migration path
 - reduces impact of broadcast storms
- **References:**
 - TCP/IP Illustrated **Stevens**
 - Netware LAN Analysis **Chappell**
 - LAN Protocol Handbook **Miller**
 - ISRB Specification and Guide **Magellan**
