NAME

filter − select which sessions of RSVP debugging output are displayed

SYNOPSIS

filter [**on**] [**off** *node_name*] [**[+/−] address**]

DESCRIPTION

Filter selects which RSVP messages are selected according to the IP address.

In the normal operation of *rsvpd*, all debugging messages of all sessions are logged as requested by the debugging mask and debugging level. *Filter* allows a user to request that messages of only specific sessions specified by IP address are logged. By default, *rsvpd* has filtering turned off. The *on* and *off* options turn filtering on and off respectively. When filtering is on, IP addresses to filter on can be added and removed from the current filtering list.

OPTIONS

on Turn on filtering

off Turn off filtering

[+]address
Adds *address* to the list of RSVP sessions for which RSVP debugging messages are printed.

−address
Removes *address* from the list of RSVP sessions for which RSVP debugging messages are printed.
