

## Features

- 3.0V to 5.5V Operation
- Industry Standard Architecture
  - Emulates Many 20-pin PALs®
  - Low-cost Easy-to-use Software Tools
- High-speed
  - 10 ns Maximum Pin-to-pin Delay
- Ultra-low Power
  - 5  $\mu$ A (Max) Pin-controlled Power-down Mode Option
  - Typical 100 nA Standby
- CMOS and TTL Compatible Inputs and Outputs
  - I/O Pin Keeper Circuits
- Advanced Flash Technology
  - Reprogrammable
  - 100% Tested
- High-reliability CMOS Process
  - 20 Year Data Retention
  - 100 Erase/Write Cycles
  - 2,000V ESD Protection
  - 200 mA Latchup Immunity
- Commercial and Industrial Temperature Ranges
- Dual-in-line and Surface Mount Packages in Standard Pinouts
- Inputs are 5V Tolerant

## Description

The ATF16LV8C is a high-performance EECMOS Programmable Logic Device that utilizes Atmel's proven electrically-erasable Flash memory technology. Speeds down to 10 ns and a 5  $\mu$ A pin-controlled power-down mode option are offered. All speed

ranges are specified over the full 3.0V to 5.25V range for industrial and commercial temperature ranges.

The ATF16LV8C incorporates a superset of the generic architectures, which allows direct replacement of the 16R8 family and most 20-pin combinatorial PLDs. Eight outputs are each allocated eight product terms. Three different modes of operation, configured automatically with software, allow highly complex logic functions to be realized.

The ATF16LV8C can significantly reduce total system power, thereby enhancing system reliability and reducing power supply costs. When pin 4 is configured as the power-down control pin, supply current drops to less than 5  $\mu$ A whenever the pin is high. If the power-down feature isn't required for a particular application, pin 4 may be used as a logic input. Also, the pin keeper circuits eliminate the need for internal pull-up resistors along with their attendant power consumption.

## Absolute Maximum Ratings\*

Temperature Under Bias.....	-40°C to +85°C
Storage Temperature.....	-65°C to +150°C
Voltage on Any Pin with Respect to Ground .....	-2.0V to +7.0V <sup>(1)</sup>
Voltage on Input Pins with Respect to Ground During Programming.....	-2.0V to +14.0V <sup>(1)</sup>
Programming Voltage with Respect to Ground .....	-2.0V to +14.0V <sup>(1)</sup>

**\*NOTICE:** Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. Minimum voltage is -0.6V DC, which may undershoot to -2.0V for pulses of less than 20 ns. Maximum output pin voltage is  $V_{CC} + 0.75V$  DC, which may overshoot to 7.0V for pulses of less than 20 ns.

  3. Clock and input transitions are ignored.

## Input Test Waveforms and Measurement Levels:

## Output Test Loads: Commercial

Note: Similar devices are tested with slightly different loads. These load differences may affect output signals' delay and slew rate. Atmel devices are tested with sufficient margins to meet compatible devices.

## Pin Capacitance

( $f = 1\text{MHz}$ ,  $T = 25^\circ\text{C}$ )<sup>(1)</sup>

	Typ	Max	Units	Conditions
$C_{IN}$	5	8	pF	$V_{IN} = 0\text{V}$
$C_{OUT}$	6	8	pF	$V_{OUT} = 0\text{V}$

Note: 1. Typical values for nominal supply voltage. This parameter is only sampled and is not 100% tested.

## Power-up Reset

The ATF16LV8C's registers are designed to reset during power-up. At a point delayed slightly from  $V_{CC}$  crossing  $V_{RST}$ , all registers will be reset to the low state. As a result, the registered output state will always be high on power-up.

This feature is critical for state machine initialization. However, due to the asynchronous nature of reset and the uncertainty of how  $V_{CC}$  actually rises in the system, the following conditions are required:

1. The  $V_{CC}$  rise must be monotonic from below 0.7V.
2. The signals from which the clock is derived must remain stable during  $T_{PR}$ .
3. After  $T_{PR}$ , all input and feedback setup times must be met before driving the clock term high.

Parameter	Description	Typ	Max	Units
$T_{PR}$	Power-up Reset Time	600	1,000	ns
$V_{RST}$	Power-up Reset Voltage	2.5	3.0	V

## Using “C” Product for Industrial

To use commercial product for industrial temperature ranges, simply de-rate  $I_{CC}$  by 15% on the “C” device. No speed de-rating is necessary.
