

### Key Features

- ◆ Laser-Configured ASIC (LASIC™) technology offers the ultimate combination of performance, flexibility, and low cost
- ◆ Functionally, architecturally, and electrically compatible with industry-standard FLEX® 8000A™ series FPGAs
- ◆ High Density
  - 4,000 Usable gates
  - 452 Flip-flops
  - 120 Maximum user I/O pins
- ◆ Laser fuse technology provides very fast, dense interconnect routing
- ◆ Optional Instant-On configuration eliminates the need for an external configuration EPROM
- ◆ Fabricated using 0.5 micron CMOS process
- ◆ Very low current consumption (active and standby)
- ◆ Alpha particle immune

## Description

The Clear Logic CL8000 Laser-Configured ASIC (LASIC™) family offers the ultimate combination of performance, flexibility, and cost. This family is a system level second source to Altera Flex® 8000™ products. For designs not requiring in-system reprogrammability, design verification can be performed using the programmable Altera devices, and Clear Logic LASICs can be used for low cost, high volume production.

Clear Logic's innovative laser ASIC technology eliminates NRE costs, test vector development, ordering minimums and long lead times. No re-simulation or re-layout is required, as the device is engineered using a cell-based, PLD-like architecture. Clear Logic's TestCell™ technology ensures complete test coverage through the use of specialized testing modes which are transparent to the user.

The Clear Logic CL8000 Laser-Configured ASIC family is based upon a large array of logic elements. Each logic element contains a configurable look up table for combinatorial functions and a register for sequential operations. A group of eight logic elements forms a block. Laser-configured metal fuses implement logical functions and control signal routing

Laser configuration provides reduced cost and enhanced performance. These inherent performance benefits include extremely consistent propagation delays, reduced power consumption, and improved immunity to noise and upset events.

## Configuration

Clear Logic's CL8000 LASIC family is compatible with all six configuration modes defined for the Flex 8000 product family. These configuration modes include the following:

- ◆ Active Serial
- ◆ Active Parallel Up
- ◆ Active Parallel Down
- ◆ Passive Parallel Synchronous
- ◆ Passive Parallel Asynchronous
- ◆ Passive Serial

The CL8000 is already configured when it is shipped, and can be configured to bypass the FLEX 8000 configuration modes.

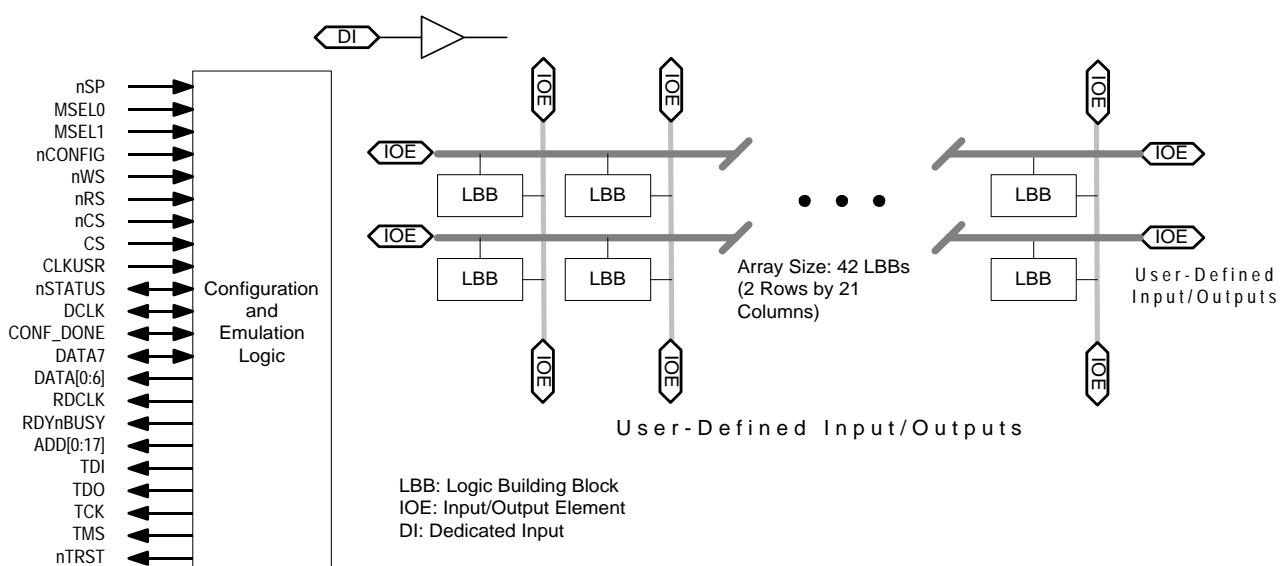

This “Instant-On” configuration mode eliminates the need for external EPROMs or microcode. In the Instant-On mode, the CL8000 device begins Initialization immediately upon a low-to-high transition on the nCONFIG pin.

## AC Test Conditions

## Notes to Tables

- During transitions, inputs may undershoot to -2.0v for periods shorter than 20ns. Otherwise, minimum DC input voltage is 0.3v.
- The following devices do not have V<sub>CCIO</sub> pins: CL8282A, CL8452A. For these devices, all references to V<sub>CCIO</sub> should be changed to V<sub>CCINT</sub>.
- Typical values are at V<sub>CC</sub> of 5.0 volts and ambient temperature of 25 °C.
- Guaranteed but not tested. Characterized initially, and after any design changes which may affect these parameters.
- Internal timing delays are based on characterization, and cannot be explicitly tested. Internal timing parameters should be used for performance estimation only.
