

## Introduction

This data sheet module describes the various pins on a Spartan™-3 FPGA and how they connect to the supported component packages.

- The **Pin Types** section categorizes all of the FPGA pins by their function type.
- The **Pin Definitions** section provides a top-level description for each pin on the device.
- The **Detailed, Functional Pin Descriptions** section offers significantly more detail about each pin, especially for the dual- or special-function pins used during device configuration.
- Some pins have associated optional behavior, controlled by settings in the configuration bitstream. These options are described in the **Bitstream Options** section.

*Table 1: Types of Pins on Spartan-3 FPGAs*

Type/ Color Code	Description	Pin Name(s) in Type
I/O	Unrestricted, general-purpose user-I/O pin. Most pins can be paired together to form differential I/Os.	IO, IO_Lxxxy_#
DUAL	Dual-purpose pin used in some configuration modes during the configuration process and then usually available as a user I/O after configuration. If the pin is not used during configuration, this pin behaves as an I/O-type pin. There are 12 dual-purpose configuration pins on every package.	IO_Lxxxy_#/DIN/D0, IO_Lxxxy_#/D1, IO_Lxxxy_#/D2, IO_Lxxxy_#/D3, IO_Lxxxy_#/D4, IO_Lxxxy_#/D5, IO_Lxxxy_#/D6, IO_Lxxxy_#/D7, IO_Lxxxy_#/CS_B, IO_Lxxxy_#/RDWR_B, IO_Lxxxy_#/BUSY/DOUT, IO_Lxxxy_#/INIT_B
CONFIG	Dedicated configuration pin. Not available as a user-I/O pin. Every package has seven dedicated configuration pins. These pins are powered by VCCAUX.	CCLK, DONE, M2, M1, M0, PROG_B, HSWAP_EN
JTAG	Dedicated JTAG pin. Not available as a user-I/O pin. Every package has four dedicated JTAG pins. These pins are powered by VCCAUX.	TDI, TMS, TCK, TDO
DCI	Dual-purpose pin that is either a user-I/O pin or used to calibrate output buffer impedance for a specific bank using Digital Controlled Impedance (DCI). There are two DCI pins per I/O bank.	IO/VRN_# IO_Lxxxy_#/VRN_# IO/VRP_# IO_Lxxxy_#/VRP_#
VREF	Dual-purpose pin that is either a user-I/O pin or, along with all other VREF pins in the same bank, provides a reference voltage input for certain I/O standards. If used for a reference voltage within a bank, all VREF pins within the bank must be connected.	IO/VREF_# IO_Lxxxy_#/VREF_#

Table 1: Types of Pins on Spartan-3 FPGAs (Continued)

Type/ Color Code	Description	Pin Name(s) in Type
GND	Dedicated ground pin. The number of GND pins depends on the package used. All must be connected.	GND
VCCAUX	Dedicated auxiliary power supply pin. The number of VCCAUX pins depends on the package used. All must be connected to +2.5V.	VCCAUX
VCCINT	Dedicated internal core logic power supply pin. The number of VCCINT pins depends on the package used. All must be connected to +1.2V.	VCCINT
VCCO	Dedicated I/O bank, output buffer power supply pin. Along with other VCCO pins in the same bank, this pin supplies power to the output buffers within the I/O bank and sets the input threshold voltage for some I/O standards.	VCCO_# <b>TQ144 Package Only:</b> VCCO_LEFT, VCCO_TOP, VCCO_RIGHT, VCCO_BOTTOM
GCLK	Dual-purpose pin that is either a user-I/O pin or an input to a specific global buffer input. Every package has eight dedicated GCLK pins.	IO_Lxxxy_#/GCLK0, IO_Lxxxy_#/GCLK1, IO_Lxxxy_#/GCLK2, IO_Lxxxy_#/GCLK3, IO_Lxxxy_#/GCLK4, IO_Lxxxy_#/GCLK5, IO_Lxxxy_#/GCLK6, IO_Lxxxy_#/GCLK7
N.C.	This package pin is not connected in this specific device/package combination but may be connected in larger devices in the same package.	N.C.

**Notes:**

1. # = I/O bank number, an integer between 0 and 7.

I/Os with Lxxxy\_# are part of a differential output pair. 'L' indicates differential output capability. The "xx" field is a two-digit integer, unique to each bank that identifies a differential pin-pair. The 'y' field is either 'P' for the true signal or 'N' for the inverted signal in the differential pair. The '#' field is the I/O bank number.

**Pin Definitions**

Table 2 provides a brief description of each pin listed in the Spartan-3 pinout tables and package footprint diagrams. Pins are categorized by their pin type, as listed in Table 1. See **Detailed, Functional Pin Descriptions** for more information.

Table 2: Spartan-3 Pin Definitions

Pin Name	Direction	Description
<b>I/O: General-purpose I/O pins</b>		
I/O	User-defined as input, output, bidirectional, three-state output, open-drain output, open-source output	<b>User I/O:</b> Unrestricted single-ended user-I/O pin. Supports all I/O standards except the differential standards.
I/O_Lxxxy_#	User-defined as input, output, bidirectional, three-state output, open-drain output, open-source output	<b>User I/O, Half of Differential Pair:</b> Unrestricted single-ended user-I/O pin or half of a differential pair. Supports all I/O standards including the differential standards.
<b>DUAL: Dual-purpose configuration pins</b>		
IO_Lxxxy_#/DIN/D0, IO_Lxxxy_#/D1, IO_Lxxxy_#/D2, IO_Lxxxy_#/D3, IO_Lxxxy_#/D4, IO_Lxxxy_#/D5, IO_Lxxxy_#/D6, IO_Lxxxy_#/D7	Input during configuration  Possible bidirectional I/O after configuration if SelectMap port is retained.  Otherwise, user I/O after configuration	<b>Configuration Data Port:</b>  In Parallel (SelectMAP) modes, D0-D7 are byte-wide configuration data pins. These pins become user I/Os after configuration unless the SelectMAP port is retained via the Persist bitstream option.  In Serial modes, DIN (D0) serves as the single configuration data input. This pin becomes a user I/O after configuration unless retained by the Persist bitstream option.
IO_Lxxxy_#/CS_B	Input during Parallel mode configuration  Possible input after configuration if SelectMap port is retained.  Otherwise, user I/O after configuration	<b>Chip Select for Parallel Mode Configuration:</b>  In Parallel (SelectMAP) modes, this is the active-Low Chip Select signal. This pin becomes a user I/O after configuration unless the SelectMAP port is retained via the Persist bitstream option.
IO_Lxxxy_#/RDWR_B	Input during Parallel mode configuration  Possible input after configuration if SelectMap port is retained.  Otherwise, user I/O after configuration	<b>Read/Write Control for Parallel Mode Configuration:</b>  In Parallel (SelectMAP) modes, this is the active-Low Write Enable, active-High Read Enable signal. This pin becomes a user I/O after configuration unless the SelectMAP port is retained via the Persist bitstream option.
IO_Lxxxy_#/BUSY/DOUT	Output during configuration  Possible output after configuration if SelectMap port is retained.  Otherwise, user I/O after configuration	<b>Configuration Data Rate Control for Parallel Mode, Serial Data Output for Serial Mode:</b>  In Parallel (SelectMAP) modes, BUSY throttles the rate at which configuration data is loaded. This pin becomes a user I/O after configuration unless the SelectMAP port is retained via the Persist bitstream option.  In Serial modes, DOUT provides preamble and configuration data to downstream devices in a multi-FPGA daisy-chain. This pin becomes a user I/O after configuration.

Table 2: Spartan-3 Pin Definitions (Continued)

Pin Name	Direction	Description
IO_Lxxxy_#/INIT_B	Bidirectional (open-drain) during configuration User I/O after configuration	<b>Initializing Configuration Memory/Detected Configuration Error:</b> When Low, this pin indicates that configuration memory is being cleared. When held Low, this pin delays the start of configuration. After this pin is released or configuration memory is cleared, the pin goes High. During configuration, a Low on this output indicates that a configuration data error occurred. This pin becomes a user I/O after configuration.
<b>DCI:</b> Digitally Controlled Impedance reference resistor input pins		
IO_Lxxxy_#/VRN_# or IO/VRN_#	Input when using DCI Otherwise, same as I/O	<b>DCI Reference Resistor for NMOS I/O Transistor (per bank):</b> If using DCI, a 1% precision impedance-matching resistor is connected between this pin and the VCCO supply for this bank. Otherwise, this pin is a user I/O.
IO_Lxxxy_#/VRP_# or IO/VRP_#	Input when using DCI Otherwise, same as I/O	<b>DCI Reference Resistor for PMOS I/O Transistor (per bank):</b> If using DCI, a 1% precision impedance-matching resistor is connected between this pin and the ground supply. Otherwise, this pin is a user I/O.
<b>GCLK:</b> Global clock buffer inputs		
IO_Lxxxy_#/GCLK0, IO_Lxxxy_#/GCLK1, IO_Lxxxy_#/GCLK2, IO_Lxxxy_#/GCLK3, IO_Lxxxy_#/GCLK4, IO_Lxxxy_#/GCLK5, IO_Lxxxy_#/GCLK6, IO_Lxxxy_#/GCLK7	Input if connected to global clock buffers Otherwise, same as I/O	<b>Global Buffer Input:</b> Direct input to a low-skew global clock buffer. If not connected to a global clock buffer, this pin is a user I/O.
<b>VREF:</b> I/O bank input reference voltage pins		
IO_Lxxxy_#/VREF_# or IO/VREF_#	Voltage supply input when VREF pins are used within a bank. Otherwise, same as I/O	<b>Input Buffer Reference Voltage for Special I/O Standards (per bank):</b> If required to support special I/O standards, all the VREF pins within a bank connect to a input threshold voltage source. If not used as input reference voltage pins, these pins are available as individual user-I/O pins.
<b>CONFIG:</b> Dedicated configuration pins		
CCLK	Input in Slave configuration modes Output in Master configuration modes	<b>Configuration Clock:</b> The configuration clock signal synchronizes configuration data.
PROG_B	Input	<b>Program/Configure Device:</b> Active Low asynchronous reset to configuration logic. Asserting PROG_B Low for an extended period delays the configuration process. This pin has an internal weak pull-up resistor during configuration.

Table 2: Spartan-3 Pin Definitions (*Continued*)

Pin Name	Direction	Description
DONE	Bidirectional with open-drain or totem-pole Output	<p><b>Configuration Done, Delay Start-up Sequence:</b> A Low-to-High output transition on this bidirectional pin signals the end of the configuration process.</p> <p>The FPGA produces a Low-to-High transition on this pin to indicate that the configuration process is complete. The DriveDone bitstream generation option defines whether this pin functions as a totem-pole output that actively drives High or as an open-drain output. An open-drain output requires a pull-up resistor to produce a High logic level. The open-drain option permits the DONE lines of multiple FPGAs to be tied together, so that the common node transitions High only after all of the FPGAs have completed configuration. Externally holding the open-drain output Low delays the start-up sequence, which marks the transition to user mode.</p>
M0, M1, M2	Input	<p><b>Configuration Mode Selection:</b> These inputs select the configuration mode. The logic levels applied to the mode pins are sampled on the rising edge of INIT_B. See <a href="#">Table 7</a>.</p>
HSWAP_EN	Input	<p><b>Disable Weak Pull-up Resistors During Configuration:</b> A Low on this pin enables weak pull-up resistors on all pins that are not actively involved in the configuration process. A High value disables all pull-ups, allowing the non-configuration pins to float.</p>
<b>JTAG:</b> JTAG interface pins		
TCK	Input	<p><b>JTAG Test Clock:</b> The TCK clock signal synchronizes all JTAG port operations.</p>
TDI	Input	<p><b>JTAG Test Data Input:</b> TDI is the serial data input for all JTAG instruction and data registers.</p>
TMS	Input	<p><b>JTAG Test Mode Select:</b> The serial TMS input controls the operation of the JTAG port.</p>
TDO	Output	<p><b>JTAG Test Data Output:</b> TDO is the serial data output for all JTAG instruction and data registers.</p>
<b>VCCO:</b> I/O bank output voltage supply pins		
VCCO_#	Supply	<p><b>Power Supply for Output Buffer Drivers (per bank):</b> These pins power the output drivers within a specific I/O bank.</p>
<b>VCCAUX:</b> Auxiliary voltage supply pins		
VCCAUX	Supply	<p><b>Power Supply for Auxiliary Circuits:</b> +2.5V power pins for auxiliary circuits, including the Digital Clock Managers (DCMs), the dedicated configuration pins (CONFIG), and the dedicated JTAG pins. All VCCAUX pins must be connected.</p>
<b>VCCINT:</b> Internal core voltage supply pins		
VCCINT	Supply	<p><b>Power Supply for Internal Core Logic:</b> +1.2V power pins for the internal logic. All pins must be connected.</p>

Table 2: Spartan-3 Pin Definitions (Continued)

Pin Name	Direction	Description
<b>GND:</b> Ground supply pins		
GND	Supply	<b>Ground:</b> Ground pins, which are connected to the power supply's return path. All pins must be connected.
<b>N.C.:</b> Unconnected package pins		
N.C.		<b>Unconnected Package Pin:</b> These package pins are unconnected.

**Notes:**

1. All unused inputs and bidirectional pins must be tied either High or Low. For unused enable inputs, apply the level that disables the associated function. One common approach is to activate internal pull-up or pull-down resistors. An alternative approach is to externally connect the pin to either VCCO or GND.
2. All outputs are of the totem-pole type — i.e., they can drive High as well as Low logic levels — except for the cases where "Open Drain" is indicated. The latter can only drive a Low logic level and require a pull-up resistor to produce a High logic level.

## Detailed, Functional Pin Descriptions

### I/O Type: Unrestricted, General-purpose I/O Pins

After configuration, I/O-type pins are inputs, outputs, bidirectional I/O, three-state outputs, open-drain outputs, or open-source outputs, as defined in the application

Pins labeled "IO" support all SelectIO™ signal standards except differential standards. A given device at most only has a few of these pins.

A majority of the general-purpose I/O pins are labeled in the format "IO\_Lxxxy\_#". These pins support all SelectIO signal standards, including the differential standards such as LVDS, ULVDS, BLVDS, RSDS, or LDT.

For additional information, see the ["IOB" section under Functional Description \(Module 2 of the Spartan-3 data sheet\)](#).

### Differential Pair Labeling

A pin supports differential standards if the pin is labeled in the format "Lxxxy\_#". The pin name suffix has the following significance. **Figure 1** provides a specific example showing a differential input to and a differential output from Bank 2.

- 'L' indicates differential capability.
- "xx" is a two-digit integer, unique for each bank, that identifies a differential pin-pair.
- 'y' is replaced by 'P' for the true signal or 'N' for the inverted. These two pins form one differential pin-pair.
- '#' is an integer, 0 through 7, indicating the associated I/O bank.

If unused, these pins are in a high impedance state. The Bit-stream generator option UnusedPin enables a weak pull-up or pull-down resistor on all unused I/O pins.

### Behavior from Power-On through End of Configuration

During the configuration process, all pins that are not actively involved in the configuration process are in a high-impedance state. The HSWAP\_EN input determines whether or not weak pull-up resistors are enabled during configuration. HSWAP\_EN = 0 enables the weak pull-up resistors. HSWAP\_EN = 1 disables the pull-up resistors allowing the pins to float, which is the desired state for hot-swap applications.

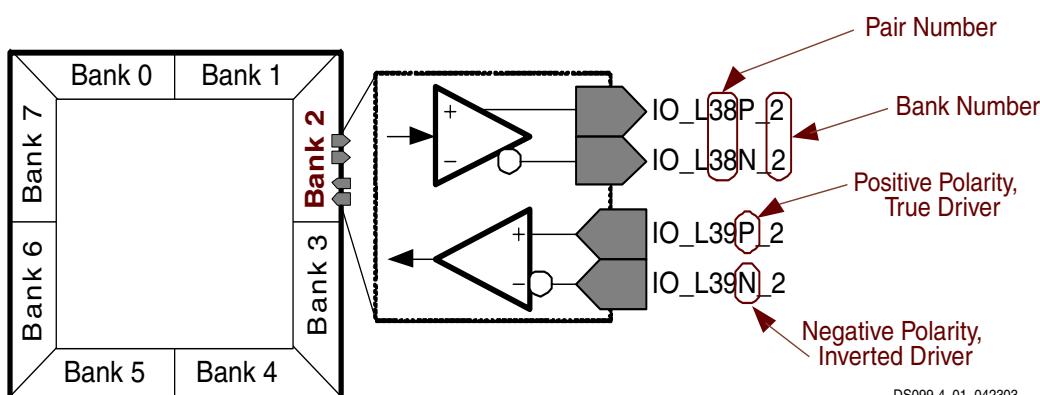

Figure 1: Differential Pair Labelling

## DUAL Type: Dual-Purpose Configuration and I/O Pins

These pins serve dual purposes. The user-I/O pins are temporarily borrowed during the configuration process to load configuration data into the FPGA. After configuration, these pins are then usually available as a user I/O in the application. If a pin is not applicable to the specific configuration mode—controlled by the mode select pins M2, M1, and M0—then the pin behaves as an I/O-type pin.

There are 12 dual-purpose configuration pins on every package, six of which are part of I/O Bank 4, the other six part of I/O Bank 5. Only a few of the pins in Bank 4 are used in the Serial configuration modes.

See “[Configuration” under Functional Description \(Module 2 of the Spartan-3 data sheet\)](#).

See “[Pin Behavior During Configuration, page 15](#)”.

**Table 3: Dual-Purpose Pins Used in Master or Slave Serial Mode**

Pin Name	Direction	Description
DIN	Input	<p><b>Serial Data Input:</b></p> <p>During the Master or Slave Serial configuration modes, DIN is the serial configuration data input, and all data is synchronized to the rising CCLK edge. After configuration, this pin is available as a user I/O.</p> <p>This signal is located in Bank 4 and its output voltage determined by VCCO_4.</p> <p>The BitGen option Persist permits this pin to retain its configuration function in the User mode.</p>
DOUT	Output	<p><b>Serial Data Output:</b></p> <p>In a multi-FPGA design where all the FPGAs use serial mode, connect the DOUT output of one FPGA—in either Master or Slave Serial mode—to the DIN input of the next FPGA—in Slave Serial mode—so that configuration data passes from one to the next, in daisy-chain fashion. This “daisy chain” permits sequential configuration of multiple FPGAs.</p> <p>This signal is located in Bank 4 and its output voltage determined by VCCO_4.</p> <p>The BitGen option Persist permits this pin to retain its configuration function in the User mode.</p>
INIT_B	Bidirectional (open-drain)	<p><b>Initializing Configuration Memory/Configuration Error:</b></p> <p>Just after power is applied, the FPGA produces a Low-to-High transition on this pin indicating that initialization (i.e., clearing) of the configuration memory has finished. Before entering the User mode, this pin functions as an open-drain output, which requires a pull-up resistor in order to produce a High logic level. In a multi-FPGA design, tie (wire AND) the INIT_B pins from all FPGAs together so that the common node transitions High only after all of the FPGAs have been successfully initialized.</p> <p>Externally holding this pin Low beyond the initialization phase delays the start of configuration. This action stalls the FPGA at the configuration step just before the mode select pins are sampled.</p> <p>During configuration, the FPGA indicates the occurrence of a data (i.e., CRC) error by asserting INIT_B Low.</p> <p>This signal is located in Bank 4 and its output voltage determined by VCCO_4.</p> <p>The BitGen option Persist permits this pin to retain its configuration function in the User mode.</p>

## Serial Configuration Modes

This section describes the dual-purpose pins used during either Master or Slave Serial mode. See [Table 7](#) for Mode Select pin settings required for Serial modes. All such pins are in Bank 4 and powered by VCCO\_4.

In both the Master and Slave Serial modes, DIN is the serial configuration data input. The D1-D7 inputs are unused in serial mode and behave like general-purpose I/O pins.

In all the cases, the configuration data is synchronized to the rising edge of the CCLK clock signal.

The DIN, DOUT, and INIT\_B pins can be retained in the application to support reconfiguration by setting the Persist bitstream generation option. However, the serial modes do not support device readback.

Configuration Data Byte	I/O Bank 4 (VCCO_4)				I/O Bank 5 (VCCO_5)			
	High Nibble				Low Nibble			
D0	D1	D2	D3	D4	D5	D6	D7	
0xA5 =	1	0	1	0	0	1	0	1

Figure 2: Configuration Data Byte Mapping to D0-D7 Bits

### Parallel Configuration Modes (*SelectMAP*)

This section describes the dual-purpose configuration pins used during the Master and Slave Parallel configuration modes, sometimes also called the SelectMAP modes. In both Master and Slave Parallel configuration modes, D0-D7 form the byte-wide configuration data input. See [Table 7](#) for Mode Select pin settings required for Parallel modes.

As shown in [Figure 2](#), D0 is the most-significant bit while D7 is the least-significant bit. Bits D0-D3 form the high nibble of the byte and bits D4-D7 form the low nibble.

In the Parallel configuration modes, both the VCCO\_4 and VCCO\_5 voltage supplies are required and must both equal the voltage of the attached configuration device, typically either 2.5V or 3.3V.

Assert Low both the chip-select pin, CS\_B, and the read/write control pin, RDWR\_B, to write the configuration data byte presented on the D0-D7 pins to the FPGA on a rising-edge of the configuration clock, CCLK. The order of

CS\_B and RDWR\_B does not matter, although RDWR\_B must be asserted throughout the configuration process. If RDWR\_B is de-asserted during configuration, the FPGA aborts the configuration operation.

After configuration, these pins are available as general-purpose user I/O. However, the SelectMAP configuration interface is optionally available for debugging and dynamic reconfiguration. To use these SelectMAP pins after configuration, set the Persist bitstream generation option.

The Readback debugging option, for example, requires the Persist bitstream generation option. During Readback mode, assert CS\_B Low, along with RDWR\_B High, to read a configuration data byte from the FPGA to the D0-D7 bus on a rising CCLK edge. During Readback mode, D0-D7 are output pins.

In all the cases, the configuration data and control signals are synchronized to the rising edge of the CCLK clock signal.

Table 4: Dual-Purpose Configuration Pins for Parallel (SelectMAP) Configuration Modes

Pin Name	Direction	Description
D0, D1, D2, D3	Input during configuration  Output during readback	<b>Configuration Data Port (high nibble):</b>  Collectively, the D0-D7 pins are the byte-wide configuration data port for the Parallel (SelectMAP) configuration modes. Configuration data is synchronized to the rising edge of CCLK clock signal.  The D0-D3 pins are the high nibble of the configuration data byte and located in Bank 4 and powered by VCCO_4.  The BitGen option Persist permits this pin to retain its configuration function in the User mode.
D4, D5, D6, D7	Input during configuration  Output during readback	<b>Configuration Data Port (low nibble):</b>  The D4-D7 pins are the low nibble of the configuration data byte. However, these signals are located in Bank 5 and powered by VCCO_5.  The BitGen option Persist permits this pin to retain its configuration function in the User mode.
CS_B	Input	<b>Chip Select for Parallel Mode Configuration:</b>  Assert this pin Low, together with RDWR_B to write a configuration data byte from the D0-D7 bus to the FPGA on a rising CCLK edge.  During Readback, assert this pin Low, along with RDWR_B High, to read a configuration data byte from the FPGA to the D0-D7 bus on a rising CCLK edge.  This signal is located in Bank 5 and powered by VCCO_5.  The BitGen option Persist permits this pin to retain its configuration function in the User mode.

CS_B	Function
0	FPGA selected. SelectMAP inputs are valid on the next rising edge of CCLK.
1	FPGA deselected. All SelectMAP inputs are ignored.

Table 4: Dual-Purpose Configuration Pins for Parallel (SelectMAP) Configuration Modes (Continued)

Pin Name	Direction	Description								
RDWR_B	Input	<p><b>Read/Write Control for Parallel Mode Configuration:</b></p> <p>In Master and Slave Parallel modes, assert this pin Low together with CS_B to write a configuration data byte from the D0-D7 bus to the FPGA on a rising CCLK edge. Once asserted during configuration, RDWR_B must remain asserted until configuration is complete.</p> <p>During Readback, assert this pin High with CS_B Low to read a configuration data byte from the FPGA to the D0-D7 bus on a rising CCLK edge.</p> <p>This signal is located in Bank 5 and powered by VCCO_5.</p> <p>The BitGen option Persist permits this pin to retain its configuration function in the User mode.</p> <table border="1" data-bbox="431 623 1450 770"> <thead> <tr> <th>RDWR_B</th><th>Function</th></tr> </thead> <tbody> <tr> <td>0</td><td>If CS_B is Low, then load (write) configuration data to the FPGA.</td></tr> <tr> <td>1</td><td>This option is valid only if the Persist bitstream option is set to Yes. If CS_B is Low, then read configuration data from the FPGA.</td></tr> </tbody> </table>	RDWR_B	Function	0	If CS_B is Low, then load (write) configuration data to the FPGA.	1	This option is valid only if the Persist bitstream option is set to Yes. If CS_B is Low, then read configuration data from the FPGA.		
RDWR_B	Function									
0	If CS_B is Low, then load (write) configuration data to the FPGA.									
1	This option is valid only if the Persist bitstream option is set to Yes. If CS_B is Low, then read configuration data from the FPGA.									
BUSY	Output	<p><b>Configuration Data Rate Control for Parallel Mode:</b></p> <p>In the Slave and Master Parallel modes, BUSY throttles the rate at which configuration data is loaded. BUSY is only necessary if CCLK operates at greater than 50 MHz. Ignore BUSY for frequencies of 50 MHz and below.</p> <p>When BUSY is Low, the FPGA accepts the next configuration data byte on the next rising CCLK edge for which CS_B and RDWR_B are Low. When BUSY is High, the FPGA ignores the next configuration data byte. The next configuration data value must be held or reloaded until the next rising CCLK edge when BUSY is Low. When CS_B is High, BUSY is in a high impedance state.</p> <table border="1" data-bbox="431 1129 1450 1320"> <thead> <tr> <th>BUSY</th><th>Function</th></tr> </thead> <tbody> <tr> <td>0</td><td>The FPGA is ready to accept the next configuration data byte.</td></tr> <tr> <td>1</td><td>The FPGA is busy processing the current configuration data byte and is not ready to accept the next byte.</td></tr> <tr> <td>Hi-Z</td><td>If CS_B is High, then BUSY is high impedance.</td></tr> </tbody> </table> <p>This signal is located in Bank 4 and its output voltage is determined by VCCO_4. The BitGen option Persist permits this pin to retain its configuration function in the User mode.</p>	BUSY	Function	0	The FPGA is ready to accept the next configuration data byte.	1	The FPGA is busy processing the current configuration data byte and is not ready to accept the next byte.	Hi-Z	If CS_B is High, then BUSY is high impedance.
BUSY	Function									
0	The FPGA is ready to accept the next configuration data byte.									
1	The FPGA is busy processing the current configuration data byte and is not ready to accept the next byte.									
Hi-Z	If CS_B is High, then BUSY is high impedance.									
INIT_B	Bidirectional (open-drain)	<p><b>Initializing Configuration Memory/Configuration Error (active-Low):</b></p> <p>See description under <b>Serial Configuration Modes</b>, page 7.</p>								

### JTAG Configuration Mode

In the JTAG configuration mode all dual-purpose configuration pins are unused and behave exactly like user-I/O pins, as shown in Table 10. See Table 7 for Mode Select pin settings required for JTAG mode.

### Dual-Purpose Pin I/O Standard During Configuration

During configuration, the dual-purpose pins default to CMOS input and output levels for the associated VCCO voltage supply pins. For example, in the Parallel configuration modes, both VCCO\_4 and VCCO\_5 are required. If connected to +2.5V, then the associated pins conform to the

LVCMS25 I/O standard. If connected to +3.3V, then the pins drive LVCMS output levels and accept either LVTTL or LVCMS input levels.

### Dual-Purpose Pin Behavior After Configuration

After the configuration process completes, these pins, if they were borrowed during configuration, become user-I/O pins available to the application. If a dual-purpose configuration pin is not used during the configuration process—i.e., the parallel configuration pins when using serial mode—then the pin behaves exactly like a general-purpose I/O. See **I/O Type: Unrestricted, General-purpose I/O Pins** section above.

## DCI: User I/O or Digitally Controlled Impedance Resistor Reference Input

These pins are individual user-I/O pins unless one of the I/O standards used in the bank requires the Digitally Controlled Impedance (DCI) feature. If DCI is used, then 1% precision resistors connected to the VRP\_# and VRN\_# pins match the impedance on the input or output buffers of the I/O standards that use DCI within the bank.

The '#' character in the pin name indicates the associated I/O bank and is an integer, 0 through 7.

There are two DCI pins per I/O bank, except in the TQ144 package, which does not have any DCI inputs for Bank 5.

### **VRP and VRN Impedance Resistor Reference Inputs**

The 1% precision impedance-matching resistor attached to the VRP\_# pin controls the pull-up impedance of PMOS transistor in the input or output buffer. Consequently, the VRP\_# pin must connect to ground. The 'P' character in "VRP" indicates that this pin controls the I/O buffer's PMOS transistor impedance. The VRP\_# pin is used for both single and split termination.

The 1% precision impedance-matching resistor attached to the VRN\_# pin controls the pull-down impedance of NMOS transistor in the input or output buffer. Consequently, the VRN\_# pin must connect to VCCO. The 'N' character in "VRN" indicates that this pin controls the I/O buffer's NMOS transistor impedance. The VRN\_# pin is only used for split termination.

Each VRN or VRP reference input requires its own resistor. A single resistor cannot be shared between VRN or VRP pins associated with different banks.

During configuration, these pins behave exactly like user-I/O pins. The associated DCI behavior is not active or valid until after configuration completes.

See "[Digitally Controlled Impedance \(DCI\)" under Functional Description \(Module 2 of the Spartan-3 data sheet\)](#).

### **DCI Termination Types**

If the I/O in an I/O bank do not use the DCI feature, then no external resistors are required and both the VRP\_# and VRN\_# pins are available for user I/O, as shown in [Figure 3a](#).

If the I/O standards within the associated I/O bank require single termination—such as GTL\_DCI, GTLP\_DCI, or HSTL\_III\_DCI—then only the VRP\_# signal connects to a 1% precision impedance-matching resistor, as shown in [Figure 3b](#). The VRN\_# pin is available for user I/O.

Finally, if the I/O standards with the associated I/O bank require split termination—such as HSTL\_I\_DCI, SSTL2\_I\_DCI, SSTL2\_II\_DCI, or LVDS\_25\_DCI and

LVDSEXT\_25\_DCI receivers—then both the VRP\_# and VRN\_# pins connect to separate 1% precision impedance-matching resistors, as shown in [Figure 3c](#). Neither pin is available for user I/O.

## GCLK: Global Clock Buffer Inputs or General-Purpose I/O Pins

These pins are user-I/O pins unless they specifically connect to one of the eight low-skew global clock buffers on the device, specified using the IBUFG primitive.

There are eight GCLK pins per device and two each appear in the top-edge banks, Bank 0 and 1, and the bottom-edge banks, Banks 4 and 5. See [Figure 1](#) for a picture of bank labeling.

During configuration, these pins behave exactly like user-I/O pins.

## CONFIG: Dedicated Configuration Pins

The dedicated configuration pins control the configuration process and are not available as user-I/O pins. Every package has seven dedicated configuration pins. All CONFIG-type pins are powered by the +2.5V VCCAUX supply.

See "["Configuration" under Functional Description \(Module 2 of the Spartan-3 data sheet\)](#).

## CCLK: Configuration Clock

The configuration clock signal on this pin synchronizes the reading or writing of configuration data. This pin is an input for the Slave configuration modes, both parallel and serial.

After configuration, the CCLK pin is in a high-impedance, floating state. By default, CCLK optionally is pulled High to VCCAUX as defined by the CclkPin bitstream selection. Any clocks applied to CCLK after configuration are ignored unless the bitstream option Persist is set to Yes, which retains the configuration interface. Persist is set to No by default. However, if Persist is set to Yes, then all clock edges are potentially active events, depending on the other configuration control signals.

The bitstream generator option ConfigRate determines the frequency of the internally-generated CCLK oscillator required for the Master configuration modes. The actual frequency is approximate due to the characteristics of the silicon oscillator and varies by up to 30% over the temperature and voltage range. By default, CCLK operates at approximately 6 MHz. Via the ConfigRate option, the oscillator frequency can be approximately 3, 6, 12, 25, 50, or 100 MHz. At power-on, CCLK always starts operation at its lowest frequency. The device does not start operating at the higher frequency until the ConfigRate control bits are loaded during the configuration process.

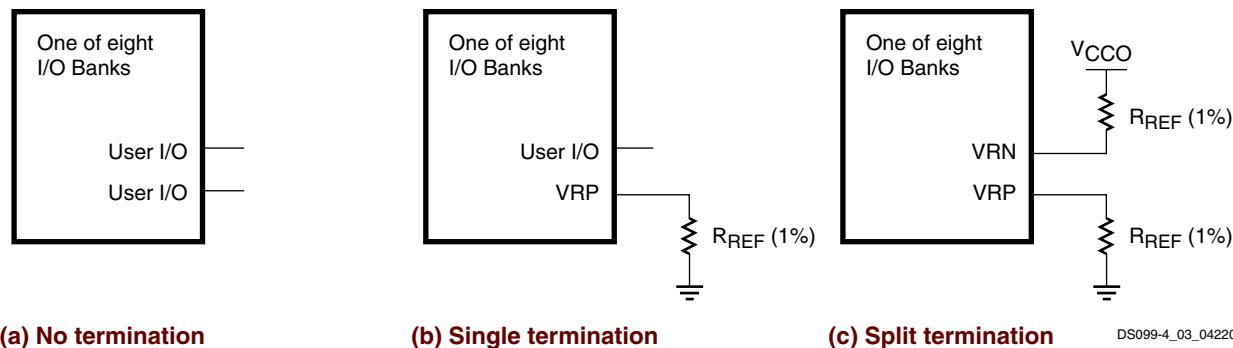

Figure 3: DCI Termination Types

DS099-4\_03\_042203

### PROG\_B: Program/Configure Device

This asynchronous pin initiates the configuration or re-configuration processes. A Low-going pulse resets the configuration logic, initializing the configuration memory. This initialization process cannot finish until PROG\_B returns High. Asserting PROG\_B Low for an extended period delays the configuration process. At power-up, there is always a weak pull-up resistor to VCCAUX on this pin. After configuration, the bitstream generator option ProgPin determines whether or not the weak pull-up resistor is present. By default, the ProgPin option retains the weak pull-up resistor.

After configuration, hold the PROG\_B input High. Any Low-going pulse on PROG\_B restarts the configuration process.

Table 5: PROG\_B Operation

PROG_B Input	Response
Power-up	Automatically initiates configuration process.
Low-going pulse	Initiate (re-)configuration process and continue to completion.
Extended Low	Initiate (re-)configuration process and stall process at step where configuration memory is cleared. Process is stalled until PROG_B returns High.
1	If the configuration process is started, continue to completion. If configuration process is complete, stay in User mode.

### DONE: Configuration Done, Delay Start-Up Sequence

The FPGA produces a Low-to-High transition on this pin indicating that the configuration process is complete. The bitstream generator option DriveDone determines whether this pin functions as a totem-pole output that can drive High or as an open-drain output. If configured as an open-drain output—which is the default behavior—then a pull-up resistor is required to produce a High logic level. There is a bitstream option that provides an internal weak pull-up resistor, otherwise an external pull-up resistor is required.

The open-drain option permits the DONE lines of multiple FPGAs to be tied together, so that the common node transitions High only after all of the FPGAs have completed configuration. Externally holding the open-drain DONE pin Low delays the start-up sequence, which marks the transition to user mode.

Once the FPGA enters User mode after completing configuration, the DONE pin no longer drives the DONE pin Low. The bitstream generator option DonePin determines whether or not a weak pull-up resistor is present on the DONE pin to pull the pin to VCCAUX. If the weak pull-up resistor is eliminated, then the DONE pin must be pulled High using an external pull-up resistor or one of the FPGAs in the design must actively drive the DONE pin High via the DriveDone bitstream generator option.

The bitstream generator option DriveDone causes the FPGA to actively drive the DONE output High after configuration. This option should only be used in single-FPGA designs or on the last FPGA in a multi-FPGA daisy-chain.

By default, the bitstream generator software retains the weak pull-up resistor and does not actively drive the DONE pin as highlighted in Table 6. Table 6 shows the interaction of these bitstream options in single- and multi-FPGA designs.

**Table 6: DonePin and DriveDone Bitstream Option Interaction**

<b>DonePin</b>	<b>DriveDone</b>	<b>Single- or Multi-FPGA Design</b>	<b>Comments</b>
Pullnone	No	Single	External pull-up resistor, with value between 330Ω to 3.3kΩ, required on DONE.
Pullnone	No	Multi	External pull-up resistor, with value between 330Ω to 3.3kΩ, required on common node connecting to all DONE pins.
Pullnone	Yes	Single	OK, no external requirements.
Pullnone	Yes	Multi	DriveDone on last device in daisy-chain only. No external requirements.
Pullup	No	Single	OK, but weak pull-up on DONE pin has slow rise time. May require 330 Ω pull-up resistor for high CCLK frequencies.
Pullup	No	Multi	External pull-up resistor, with value between 330Ω to 3.3kΩ, required on common node connecting to all DONE pins.
Pullup	Yes	Single	OK, no external requirements.
Pullup	Yes	Multi	DriveDone on last device in daisy-chain only. No external requirements.

**M2, M1, M0: Configuration Mode Selection**

These inputs select the mode to configure the FPGA. The logic levels applied to the mode pins are sampled on the rising edge of INIT\_B.

**Table 7: Spartan-3 Configuration Mode Select Settings**

<b>Configuration Mode</b>	<b>M2</b>	<b>M1</b>	<b>M0</b>
Master Serial	0	0	0
Slave Serial	1	1	1
Master Parallel	0	1	1
Slave Parallel	1	1	0
JTAG	1	0	1
Reserved	0	0	1
Reserved	0	1	0
Reserved	1	0	0
After Configuration	X	X	X

**Notes:**

1. X = don't care, either 0 or 1.

In user mode, after configuration successfully completes, any levels applied to these input are ignored. Each of the bitstream generator options M0Pin, M1Pin, and M2Pin determines whether a weak pull-up resistor, weak pull-down resistor, or no resistor is present on its respective mode pin, M0, M1, or M2.

**Hswap\_en: Disable Weak Pull-up Resistors During Configuration**

A Low on this asynchronous pin enables weak pull-up resistors on all user I/Os, although only until device configuration

completes. A High disables the weak pull-up resistors (during configuration, which is the desired state for some applications).

**Table 8: Hswap\_en Encoding**

<b>Hswap_en</b>	<b>Function</b>
<b>During Configuration</b>	
0	Enable weak pull-up resistors on all pins not actively involved in the configuration process. Pull-ups are only active until configuration completes. See <a href="#">Table 10</a> .
1	No pull-up resistors during configuration.
<b>After Configuration, User Mode</b>	
X	This pin has no function except during device configuration.

**Notes:**

1. X = don't care, either 0 or 1.

After configuration, Hswap\_en essentially becomes a "don't care" input and any pull-up resistors previously enabled by Hswap\_en are disabled. If a user I/O in the application requires a weak pull-up resistor after configuration, place a PULLUP primitive on the associated I/O pin.

The Bitstream generator option HswapenPin determines whether a weak pull-up resistor to VCCAUX, a weak pull-down resistor, or no resistor is present on Hswap\_en after configuration.

**JTAG: Dedicated JTAG Port Pins**

These pins are dedicated connections to the four-wire IEEE 1532/IEEE 1149.1 JTAG port, shown in [Figure 4](#). The JTAG

port is used for boundary-scan testing, device configuration, application debugging, and possibly an additional serial port for the application. These pins are dedicated and are not available as user-I/O pins. Every package has four dedicated JTAG pins and these pins are powered by the +2.5V VCCAUX supply.

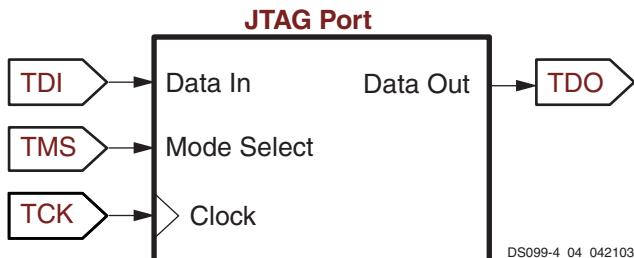

Figure 4: JTAG Port

### Using JTAG Port After Configuration

By default, the JTAG port is disabled after the configuration process completes. To continue using the JTAG port, after configuration, place a BSCAN\_SPARTAN3 primitive in the design.

Furthermore, the contents of the User ID register within the JTAG port can be specified as a Bitstream Generation option. By default, the 32-bit User ID register contains 0xFFFFFFFF.

### Precautions When Using the JTAG Port in 3.3V Environments

The JTAG port is powered by the +2.5V VCCAUX power supply. The JTAG pins can tolerate 3.3V interface signals but inputs will be clamped by the electro-static discharge

(ESD) protection diodes to VCCAUX. Similarly, the TDO pin is a CMOS output powered from +2.5V. Driving a 3.3V input from TDO may require a pull-up resistor to +3.3V.

The following interface precautions are recommended when connecting the JTAG port to a 3.3V interface.

1. Set any inactive JTAG signals, including TCK, Low when not actively used.
2. Drive the JTAG input pins with no more than 12 mA drivers.

### VREF: User I/O or Input Buffer Reference Voltage for Special Interface Standards

These pins are individual user-I/O pins unless collectively they supply an input reference voltage, VREF\_#, for any SSTL, HSTL, GTL, or GTLP I/Os implemented in the associated I/O bank.

The ' #' character in the pin name represents an integer, 0 through 7, that indicates the associated I/O bank.

The VREF function becomes active for this pin whenever a signal standard requiring a reference voltage is used in the associated bank.

If used as a user I/O, then each pin behaves as an independent I/O described in the I/O type section. If used for a reference voltage within a bank, then *all* VREF pins within the bank must be connected to the same reference voltage.

Spartan-3 devices are designed and characterized to support certain I/O standards when VREF is connected to +1.25V, +1.10V, +1.00V, +0.90V, +0.80V, and +0.75V.

During configuration, these pins behave exactly like user-I/O pins.

Table 9: JTAG Pin Descriptions

Pin Name	Direction	Description	Bitstream Generation Option
TCK	Input	<b>Test Clock:</b> The TCK clock signal synchronizes all boundary scan operations on its rising edge.	The BitGen option TckPin determines whether a weak pull-up resistor, weak pull-down resistor or no resistor is present.
TDI	Input	<b>Test Data Input:</b> TDI is the serial data input for all JTAG instruction and data registers. This input is sampled on the rising edge of TCK.	The BitGen option TdiPin determines whether a weak pull-up resistor, weak pull-down resistor or no resistor is present.
TMS	Input	<b>Test Mode Select:</b> The TMS input controls the sequence of states through which the JTAG TAP state machine passes. This input is sampled on the rising edge of TCK.	The BitGen option TmsPin determines whether a weak pull-up resistor, weak pull-down resistor or no resistor is present.
TDO	Output	<b>Test Data Output:</b> The TDO pin is the data output for all JTAG instruction and data registers. This output is sampled on the rising edge of TCK.	The BitGen option TdoPin determines whether a weak pull-up resistor, weak pull-down resistor or no resistor is present.

If designing for footprint compatibility across the range of devices in a specific package, and if the VREF\_# pins within a bank connect to an input reference voltage, then also connect any N.C. (not connected) pins on the smaller devices in that package to the input reference voltage. More details are provided later for each package type.

### N.C. Type: Unconnected Package Pins

Pins marked as “N.C.” are unconnected for the specific device/package combination. For other devices in this same package, this pin may be used as an I/O or VREF connection. In both the pinout tables and the footprint diagrams, unconnected pins are noted with either a black diamond symbol (◆) or a black square symbol (■).

If designing for footprint compatibility across multiple device densities, check the pin types of the other Spartan-3 devices available in the same footprint. If the N.C. pin matches to VREF pins in other devices, and the VREF pins are used in the associated I/O bank, then connect the N.C. to the VREF voltage source.

### VCCO Type: Output Voltage Supply for I/O Bank

Each I/O bank has its own set of voltage supply pins that determines the output voltage for the output buffers in the I/O bank. Furthermore, for some I/O standards such as LVCMOS, LVCMOS25, LVTTL, etc., VCCO sets the input threshold voltage on the associated input buffers.

Spartan-3 devices are designed and characterized to support various I/O standards for VCCO values of +1.2V, +1.5V, +1.8V, +2.5V, and +3.3V.

Most VCCO pins are labeled as VCCO\_# where the ‘#’ symbol represents the associated I/O bank number, an integer ranging from 0 to 7. In the 144-pin TQFP package (TQ144) however, the VCCO pins along an edge of the device are combined into a single VCCO input. For example, the VCCO inputs for Bank 0 and Bank 1 along the top edge of the package are combined and relabeled VCCO\_TOP. The bottom, left, and right edges are similarly combined.

In Serial configuration mode, VCCO\_4 must be at a level compatible with the attached configuration memory or data source. In Parallel configuration mode, both VCCO\_4 and VCCO\_5 must be at the same compatible voltage level.

All VCCO inputs to a bank must be connected together and to the voltage supply. Furthermore, there must be sufficient supply decoupling to guarantee problem-free operation, as described in [XAPP623: Power Distribution System \(PDS\) Design: Using Bypass/Decoupling Capacitors](#).

### VCCINT Type: Voltage Supply for Internal Core Logic

Internal core logic circuits such as the configurable logic blocks (CLBs) and programmable interconnect operate

from the VCCINT voltage supply inputs. VCCINT must be +1.2V.

All VCCINT inputs must be connected together and to the +1.2V voltage supply. Furthermore, there must be sufficient supply decoupling to guarantee problem-free operation, as described in [XAPP623: Power Distribution System \(PDS\) Design: Using Bypass/Decoupling Capacitors](#).

### VCCAUX Type: Voltage Supply for Auxiliary Logic

The VCCAUX pins supply power to various auxiliary circuits, such as to the Digital Clock Managers (DCMs), the JTAG pins, and to the dedicated configuration pins (CONFIG type). VCCAUX must be +2.5V.

All VCCAUX inputs must be connected together and to the +2.5V voltage supply. Furthermore, there must be sufficient supply decoupling to guarantee problem-free operation, as described in [XAPP623: Power Distribution System \(PDS\) Design: Using Bypass/Decoupling Capacitors](#).

Because VCCAUX connects to the DCMs and the DCMs are sensitive to voltage changes, be sure that the VCCAUX supply and the ground return paths are designed for low noise and low voltage drop, especially that caused by a large number of simultaneous switching I/Os.

### GND Type: Ground

All GND pins must be connected and have a low resistance path back to the various VCCO, VCCINT, and VCCAUX supplies.

### Pin Behavior During Configuration

**Table 10** shows how various pins behave during the FPGA configuration process. The actual behavior depends on the values applied to the M2, M1, and M0 mode select pins and the HSWAP\_EN pin. The mode select pins determine which of the DUAL type pins are active during configuration. In JTAG configuration mode, none of the DUAL-type pins are used for configuration and all behave as user-I/O pins.

All DUAL-type pins not actively used during configuration and all I/O-type, DCI-type, VREF-type, GCLK-type pins are high impedance (floating, three-stated, Hi-Z) during the configuration process. These pins are indicated in **Table 10** as shaded table entries or cells. These pins have a weak pull-up resistor to their associated VCCO if the HSWAP\_EN pin is Low.

After configuration completes, some pins have optional behavior controlled by the configuration bitstream loaded into the part. For example, via the bitstream, all unused I/O pins can collectively be configured to have a weak pull-up resistor, a weak pull-down resistor, or be left in a high-impedance state.

Table 10: Pin Behavior After Power-Up, During Configuration

Pin Name	Configuration Mode Settings <M2:M1:M0>					Bitstream Configuration Option	
	Serial Modes		SelectMap Parallel Modes		JTAG Mode <1:0:1>		
	Master <0:0:0>	Slave <1:1:1>	Master <0:1:1>	Slave <1:1:0>

VCCO_#	VCCO_#	VCCO_#	VCCO_#	VCCO_#	VCCO_#	X/X/X/X	
<b>VCCAUX:</b> Auxiliary voltage supply pins							
VCCAUX	+2.5V	+2.5V	+2.5V	+2.5V	+2.5V	X/X/X/X	

Table 10: Pin Behavior After Power-Up, During Configuration (Continued)

Pin Name	Configuration Mode Settings <M2:M1:M0>					Bitstream Configuration Option	
	Serial Modes		SelectMap Parallel Modes		JTAG Mode <1:0:1>		
	Master <0:0:0>	Slave <1:1:1>	Master <0:1:1>	Slave <1:1:0>			
<b>VCCINT:</b> Internal core voltage supply pins							
VCCINT	+1.2V	+1.2V	+1.2V	+1.2V	+1.2V		
<b>GND:</b> Ground supply pins							
GND	GND	GND	GND	GND	GND		

**Notes:**

- # = I/O bank number, an integer from 0 to 7.
- (I) = input, (O) = output, (OD) = open-drain output, (I/O) = bidirectional, (I/OD) = bidirectional with open-drain output. Open-drain output requires pull-up to create logic High level.
-  Shaded cell indicates that the pin is high-impedance during configuration. To enable a soft pull-up resistor during configuration, drive or tie HSWAP\_EN Low.

## Bitstream Options

Table 11 lists the various bitstream options that affect pins on a Spartan-3 FPGA. The table shows the names of the affected pins, describes the function of the bitstream option,

the name of the bitstream generator option variable, and the legal values for each variable. The default option setting for each variable is indicated with bold, underlined text.

Table 11: Bitstream Options Affecting Spartan-3 Pins

Affected Pin Name(s)	Bitstream Generation Function	Option Variable Name	Values (default value)
All unused I/O pins of type I/O, DUAL, GCLK, DCI, VREF	For all I/O pins that are unused after configuration, this option defines whether the I/Os are individually tied to VCCO via a weak pull-up resistor, tied ground via a weak pull-down resistor, or left floating. If left floating, the unused pins should be connected to a defined logic level, either from a source internal to the FPGA or external.	UnusedPin	<ul style="list-style-type: none"> <li><b>Pulldown</b></li> <li>• Pullup</li> <li>• Pullnone</li> </ul>
IO_Lxxxy_#/DIN, IO_Lxxxy_#/DOUT, IO_Lxxxy_#/INIT_B	Serial configuration mode: If set to Yes, then these pins retain their functionality after configuration completes, allowing for device (re-)configuration. Readback is not supported in serial mode.	Persist	<ul style="list-style-type: none"> <li>• <b>No</b></li> <li>• Yes</li> </ul>
IO_Lxxxy_#/D0, IO_Lxxxy_#/D1, IO_Lxxxy_#/D2, IO_Lxxxy_#/D3, IO_Lxxxy_#/D4, IO_Lxxxy_#/D5, IO_Lxxxy_#/D6, IO_Lxxxy_#/D7, IO_Lxxxy_#/CS_B, IO_Lxxxy_#/RDWR_B, IO_Lxxxy_#/BUSY, IO_Lxxxy_#/INIT_B	Parallel configuration mode (also called SelectMAP): If set to Yes, then these pins retain their SelectMAP functionality after configuration completes, allowing for device readback and for partial or complete (re-)configuration.	Persist	<ul style="list-style-type: none"> <li>• <b>No</b></li> <li>• Yes</li> </ul>
CCLK	After configuration, this bitstream option either pulls CCLK to VCCAUX via a weak pull-up resistor, or allows CCLK to float.	CclkPin	<ul style="list-style-type: none"> <li>• <b>Pullup</b></li> <li>• Pullnone</li> </ul>
CCLK	For Master configuration modes, this option sets the approximate frequency, in MHz, for the internal silicon oscillator.	ConfigRate	3, <b>6</b> , 12, 25, 50, 100

Table 11: Bitstream Options Affecting Spartan-3 Pins (Continued)

Affected Pin Name(s)	Bitstream Generation Function	Option Variable Name	Values (default value)
PROG_B	A weak pull-up resistor to VCCAUX exists on PROG_B during configuration. After configuration, this bitstream option either pulls DONE to VCCAUX via a weak pull-up resistor, or allows DONE to float.	ProgPin	• <b>Pullup</b> • Pullnone
DONE	After configuration, this bitstream option either pulls DONE to VCCAUX via a weak pull-up resistor, or allows DONE to float. See also DriveDone option.	DonePin	• <b>Pullup</b> • Pullnone
DONE	If set to Yes, this option allows the FPGA's DONE pin to drive High when configuration completes. By default, the DONE is an open-drain output and can only drive Low. Only single FPGAs and the last FPGA in a multi-FPGA daisy-chain should use this option.	DriveDone	• <b>No</b> • Yes
M2	After configuration, this bitstream option either pulls M2 to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows M2 to float.	M2Pin	• <b>Pullup</b> • Pulldown • Pullnone
M1	After configuration, this bitstream option either pulls M1 to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows M1 to float.	M1Pin	• <b>Pullup</b> • Pulldown • Pullnone
M0	After configuration, this bitstream option either pulls M0 to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows M0 to float.	M0Pin	• <b>Pullup</b> • Pulldown • Pullnone
Hswap_EN	After configuration, this bitstream option either pulls Hswap_EN to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows Hswap_EN to float.	HswapenPin	• <b>Pullup</b> • Pulldown • Pullnone
TDI	After configuration, this bitstream option either pulls TDI to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows TDI to float.	TdiPin	• <b>Pullup</b> • Pulldown • Pullnone
TMS	After configuration, this bitstream option either pulls TMS to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows TMS to float.	TmsPin	• <b>Pullup</b> • Pulldown • Pullnone
TCK	After configuration, this bitstream option either pulls TCK to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows TCK to float.	TckPin	• <b>Pullup</b> • Pulldown • Pullnone
TDO	After configuration, this bitstream option either pulls TDO to VCCAUX via a weak pull-up resistor, to ground via a weak pull-down resistor, or allows TDO to float.	TdoPin	• <b>Pullup</b> • Pulldown • Pullnone

## Setting Options via BitGen Command-Line Program

To set one or more bitstream generator options using the BitGen command-line program, enter

```
bitgen -g <variable_name>:<value>
[<variable_name>:<value> ...]
```

where **<variable\_name>** is one of the entries from Table 11 and **<value>** is one of the possible values for the specified variable. Multiple bitstream options may be entered in this manner.

For a complete listing of all BitGen options, their possible settings, and their default settings, enter the following command.

```
bitgen -help spartan3
```

## Setting Options in Project Navigator

To set the bitstream generation options in Xilinx ISE Project Navigator, right-click on the **Generate Programming File** step in the Process View and click **Properties**, as shown in Figure 5.

Click the **Configuration options** tab and modify the available options as required by the application, as shown in Figure 6.

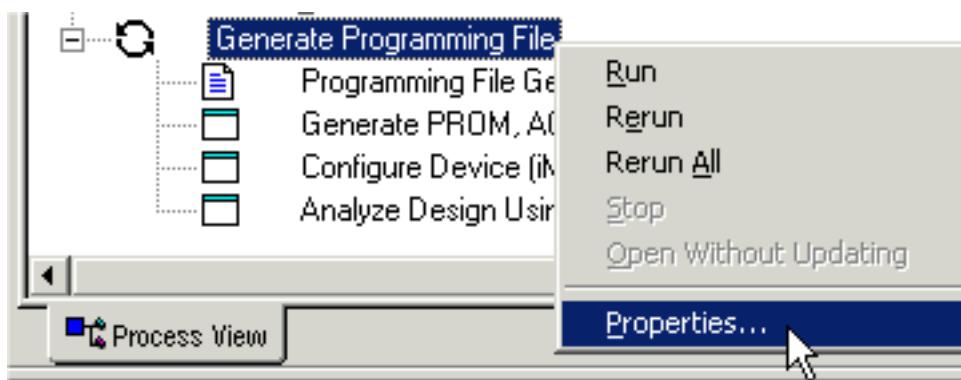

Figure 5: Setting Properties for Generate Programming File Step

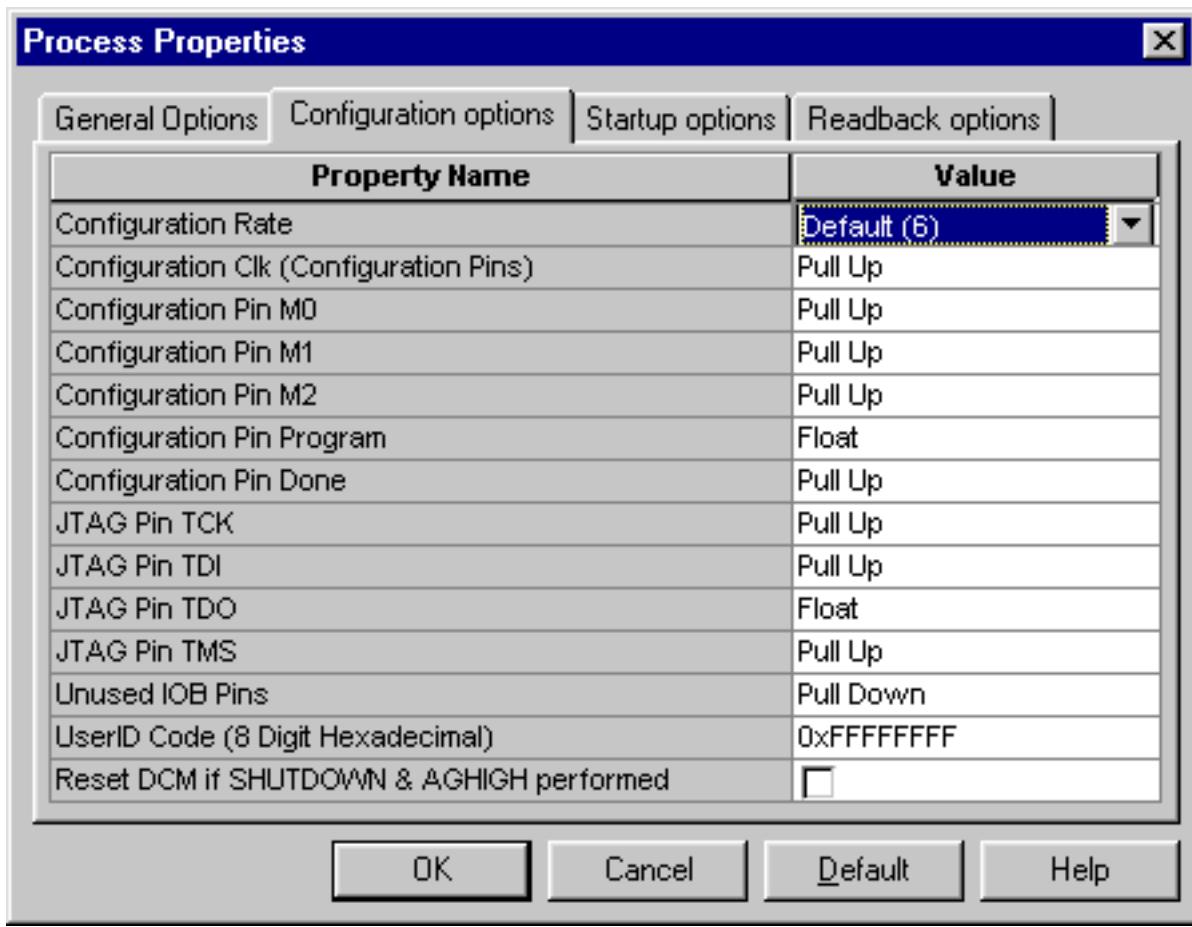

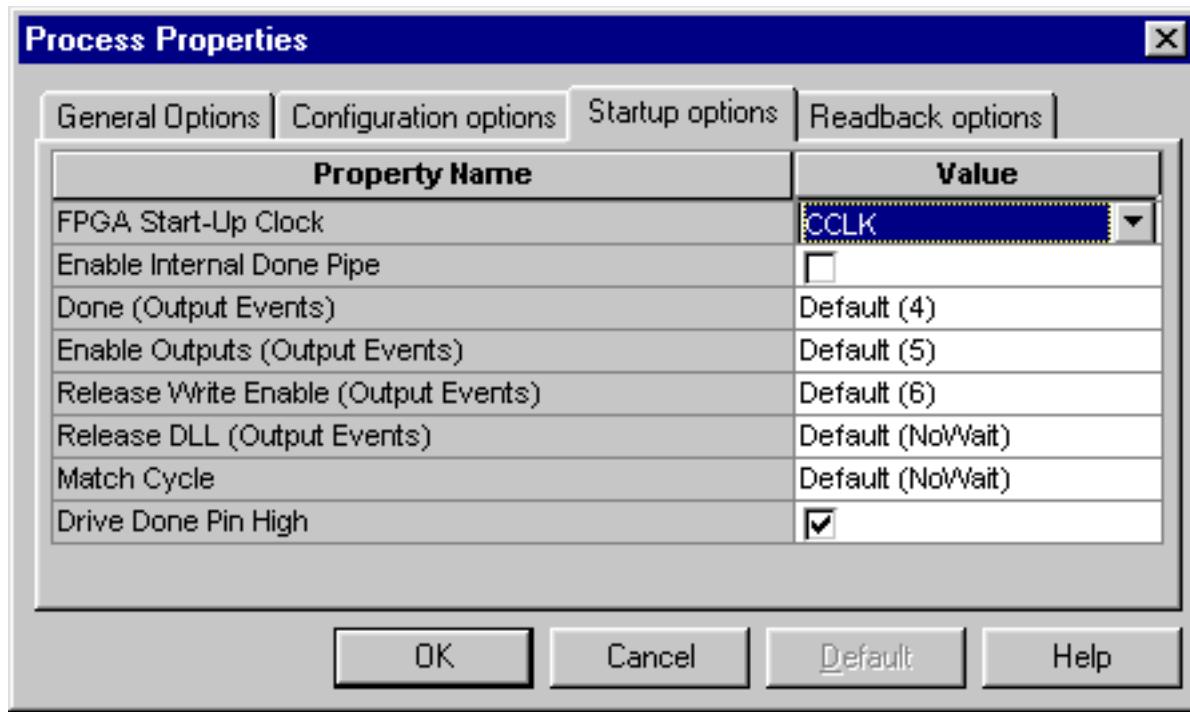

Figure 6: Configuration Option Settings

DS099-4\_07\_030103

**Figure 7: Setting to Drive DONE Pin High after Configuration**

To have the DONE pin drive High after successful configuration, click the **Startup options** tab and check the **Drive Done Pin High** box, as shown in [Figure 7](#).

Click **OK** when finished.

Again, right-click on the **Generate Programming File** step in the Process View. This time, choose **Run** or **Rerun** to execute the changes.

**Table 12: Spartan-3 Family Package Options**

Package	Leads	Type	Maximum I/O	Pitch (mm)	Area (mm)	Height (mm)
VQ100	100	Very-thin Quad Flat Pack	63	0.5	16 x 16	1.20
TQ144	144	Thin Quad Flat Pack	97	0.5	22 x 22	1.60
PQ208	208	Quad Flat Pack	141	0.5	30.6 x 30.6	4.10
FT256	256	Fine-pitch, Thin Ball Grid Array	173	1.0	17 x 17	1.55

## Package Overview

[Table 12](#) shows the eight, low-cost, space-saving production packages for the Spartan-3 family. Not all Spartan-3 densities are available in all packages. However, for a specific package there is a common footprint for that supports the various devices available in that package. See the footprint diagrams that follow.

Detailed mechanical drawings for each package type are available from the Xilinx web site at the specified location in [Table 13](#).

Table 13: Xilinx Package Mechanical Drawings

Each package has three separate voltage supply inputs—VCCINT, VCCAUX, and VCCO—and a common ground return, GND. The numbers of pins dedicated to these functions varies by package, as shown in [Table 14](#).

Table 14: Power and Ground Supply Pins by Package

Package	VCCINT	VCCAUX	VCCO	GND

Electronic versions of the package pinout tables and footprints are available for download from the Xilinx web site. Using a spreadsheet program, the data can be sorted and reformatted according to any specific needs. Similarly, the

ASCII-text file is easily parsed by most scripting programs. Download the files from the following location:

[http://www.xilinx.com/bvdocs/publications/s3\\_pin.zip](http://www.xilinx.com/bvdocs/publications/s3_pin.zip)

## VQ100: 100-lead Very-thin Quad Flat Package

The XC3S50 and the XC3S200 devices are available in the 100-lead very-thin quad flat package, VQ100. Both devices share a common footprint for this package as shown in [Table 16](#) and [Figure 8](#).

All the package pins appear in [Table 16](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

### Pinout Table

*Table 16: VQ100 Package Pinout*

**User I/Os by Bank**

Table 17 indicates how the available user-I/O pins are distributed between the eight I/O banks on the VQ100 package.

**Table 17: User I/Os Per Bank in VQ100 Package**

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	6	1	0	2	1	2
	1	7	2	0	2	1	2
Right	2	8	5	0	2	1	0
	3	8	5	0	2	1	0
Bottom	4	10	0	6	2	0	2
	5	8	0	6	0	0	2
Left	6	8	4	0	2	2	0
	7	8	5	0	2	1	0

## VQ100 Footprint

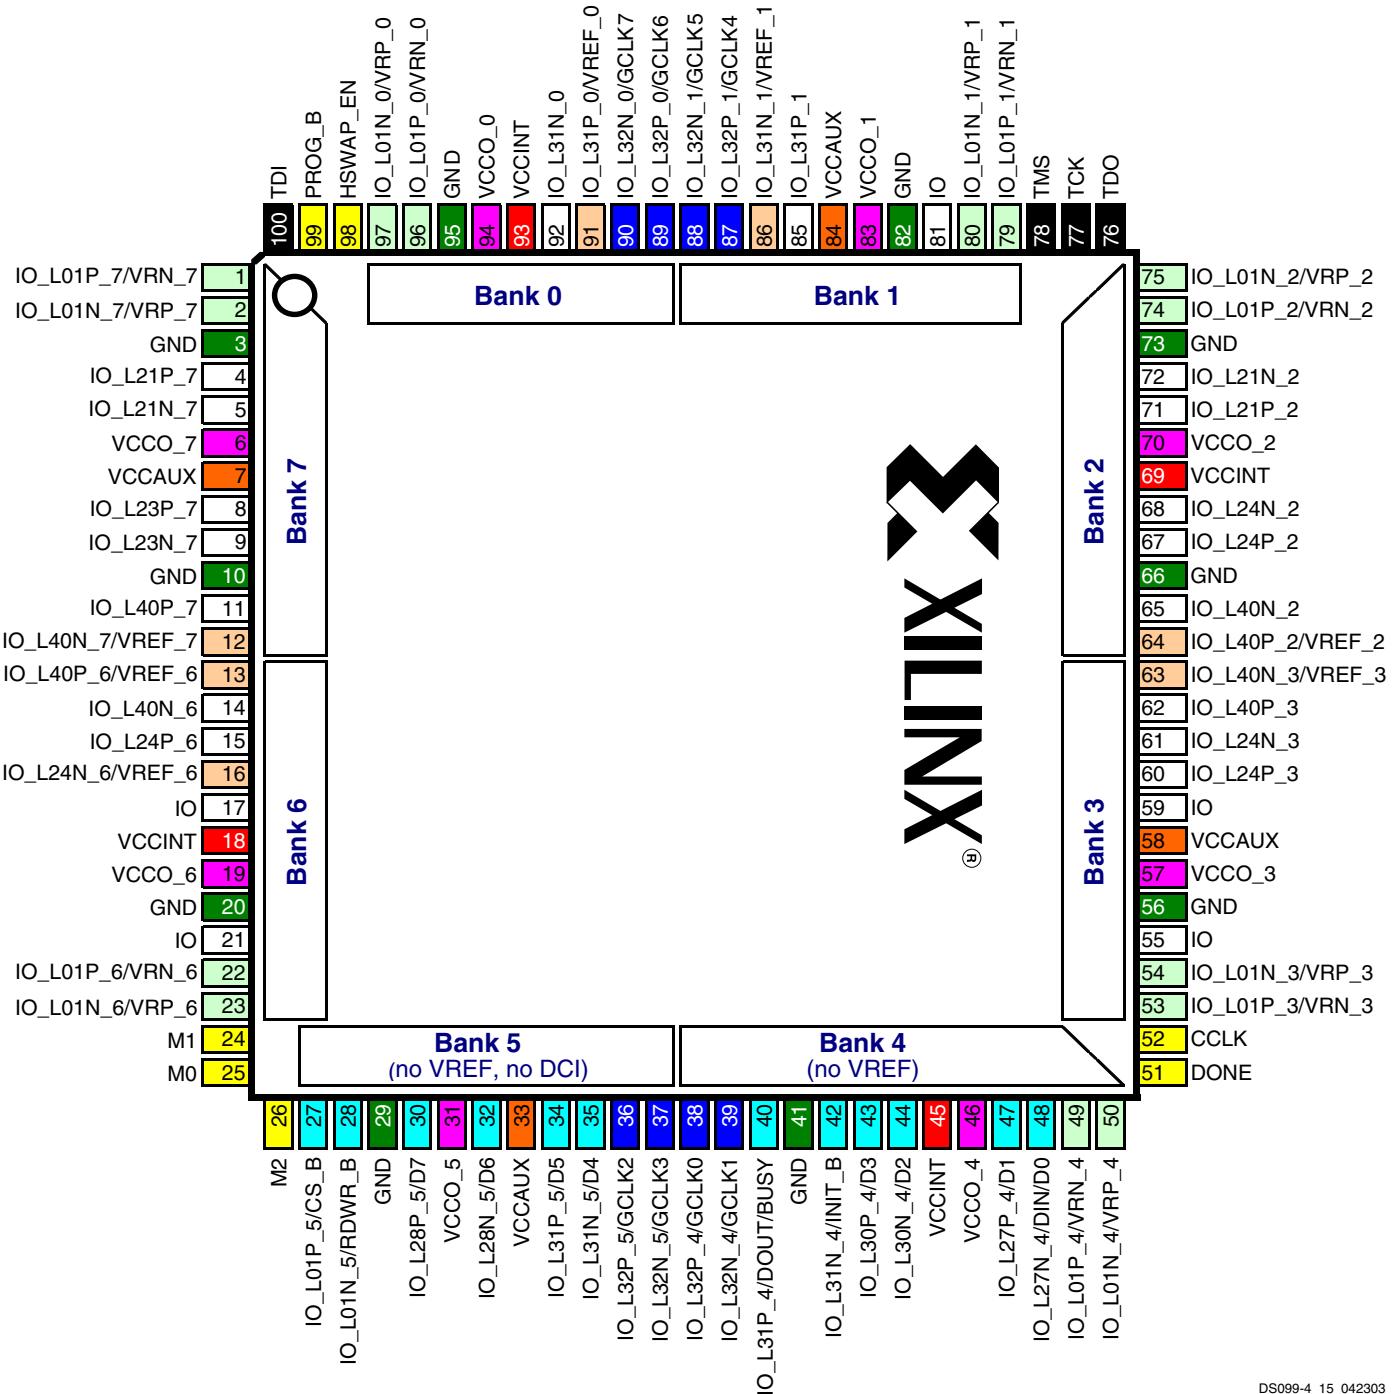

Figure 8: VQ100 Package Footprint (top view). Note pin 1 indicator in top-left corner and logo orientation.

22	I/O: Unrestricted, general-purpose user I/O	12	DUAL: Configuration pin, then possible user I/O	7	VREF: User I/O or input voltage reference for bank
14	DCI: User I/O or reference resistor input for bank	8	GCLK: User I/O or global clock buffer input	8	VCCO: Output voltage supply for bank
7	CONFIG: Dedicated configuration pins	4	JTAG: Dedicated JTAG port pins	4	VCCINT: Internal core voltage supply (+1.2V)
0	N.C.: No unconnected pins in this package	10	GND: Ground	4	VCCAUX: Auxiliary voltage supply (+2.5V)

## TQ144: 144-lead Thin Quad Flat Package

The XC3S50, the XC3S200, and the XC3S400 are available in the 144-lead thin quad flat package, TQ144. Consequently, there is only one footprint for this package as shown in [Table 18](#) and [Figure 9](#).

The TQ144 package only has four separate VCCO inputs, unlike the other packages, which have eight separate VCCO inputs. The TQ144 package has a separate VCCO input for the top, bottom, left, and right. However, there are still eight separate I/O banks, as shown in [Table 18](#) and [Figure 9](#). Banks 0 and 1 share the VCCO\_TOP input, Banks 2 and 3 share the VCCO\_RIGHT input, Banks 4 and 5 share the VCCO\_BOTTOM input, and Banks 6 and 7 share the VCCO\_LEFT input.

All the package pins appear in [Table 18](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

### Pinout Table

*Table 18: TQ144 Package Pinout*

## User I/Os by Bank

**Table 19** indicates how the available user-I/O pins are distributed between the eight I/O banks on the TQ144 package.

**Table 19: User I/Os Per Bank in TQ144 Package**

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	10	5	0	2	1	2
	1	9	4	0	2	1	2
Right	2	14	10	0	2	2	0
	3	15	11	0	2	2	0
Bottom	4	11	0	6	2	1	2
	5	9	0	6	0	1	2
Left	6	14	10	0	2	2	0
	7	15	11	0	2	2	0

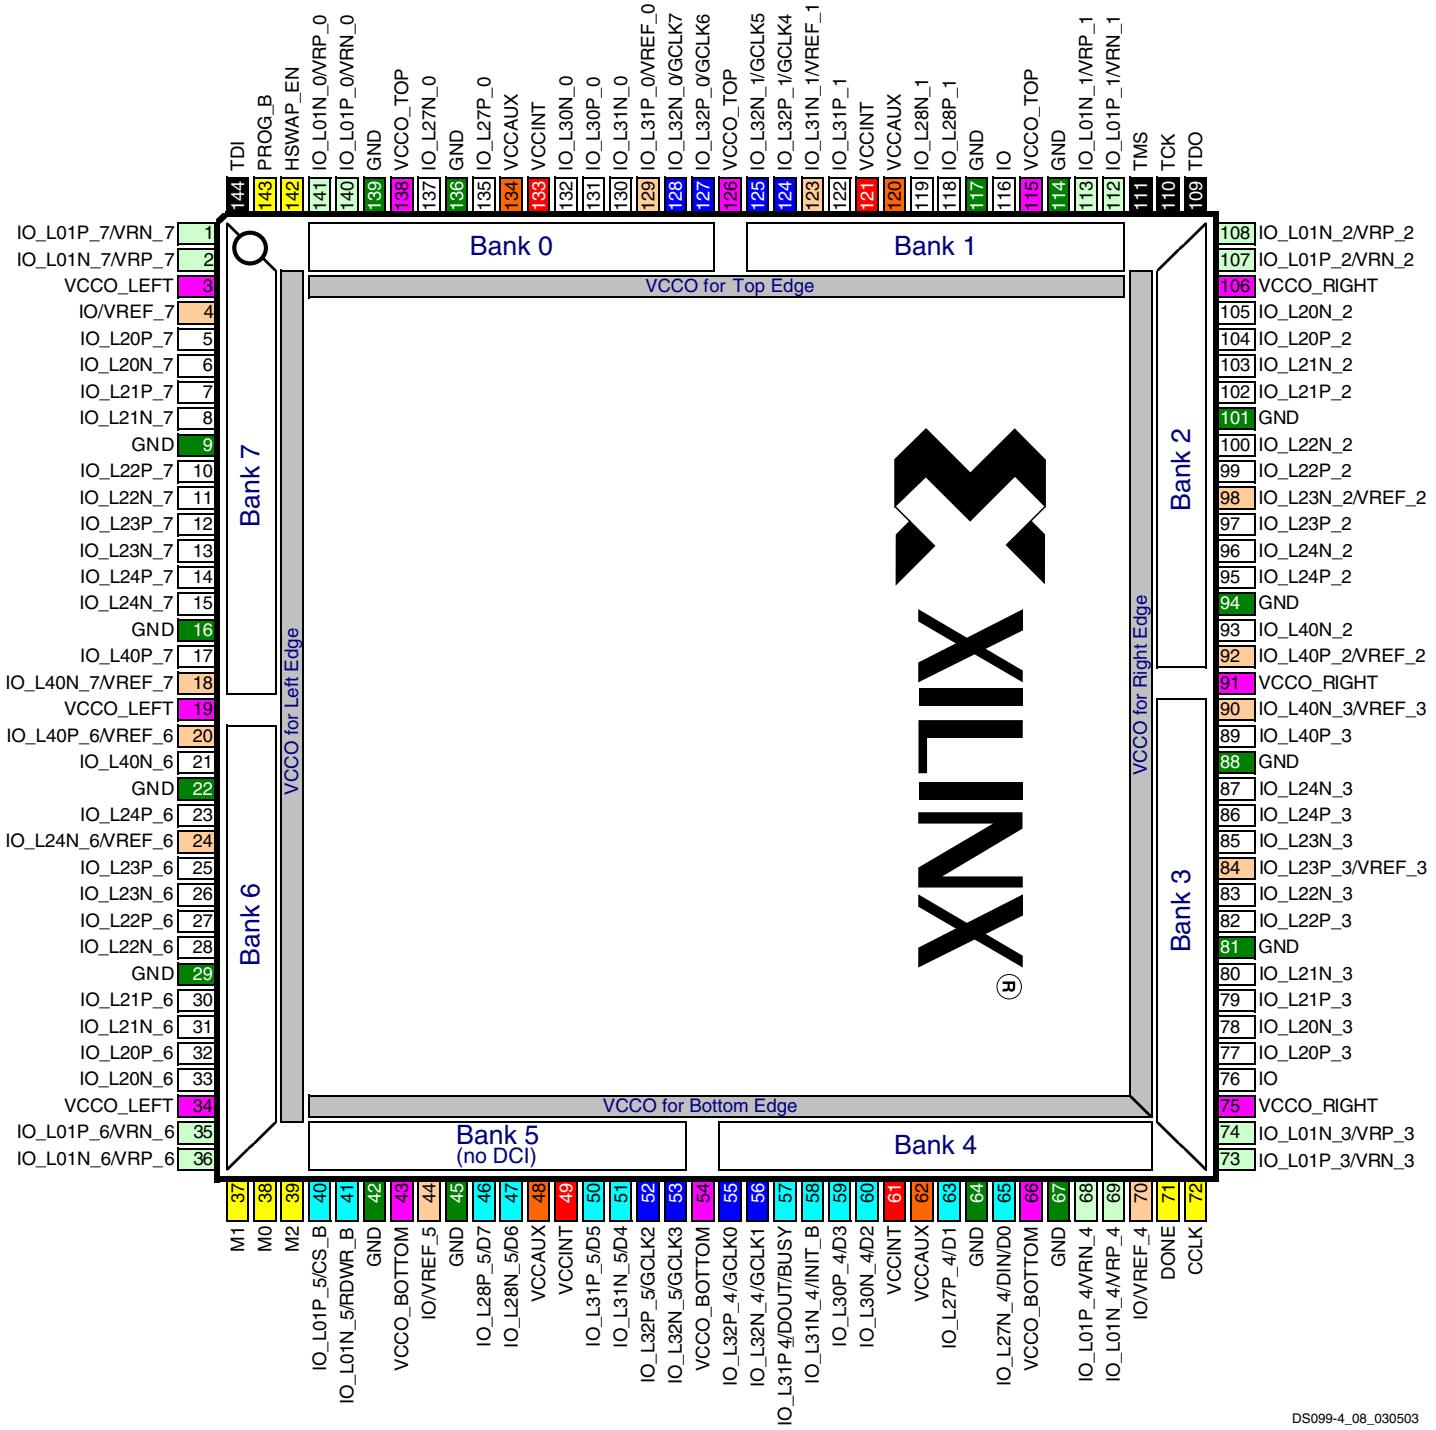

**TQ144 Footprint**

Figure 9: TQ144 Package Footprint (top view). Note pin 1 indicator in top-left corner and logo orientation.

51	I/O: Unrestricted, general-purpose user I/O	12	DUAL: Configuration pin, then possible user I/O	12	VREF: User I/O or input voltage reference for bank
14	DCI: User I/O or reference resistor input for bank	8	GCLK: User I/O or global clock buffer input	12	VCCO: Output voltage supply for bank
7	CONFIG: Dedicated configuration pins	4	JTAG: Dedicated JTAG port pins	4	VCCINT: Internal core voltage supply (+1.2V)
0	N.C.: No unconnected pins in this package	16	GND: Ground	4	VCCAUX: Auxiliary voltage supply (+2.5V)

## PQ208: 208-lead Plastic Quad Flat Pack

The 208-lead plastic quad flat package, PQ208, supports three different Spartan-3 devices, including the XC3S50, the XC3S200, and the XC3S400. The footprints for the XC3S200 and XC3S400 are identical, as shown in [Table 20](#) and [Figure 10](#). The XC3S50, however, has fewer I/O pins resulting in 17 unconnected pins on the PQ208 package, labeled as “N.C.” In [Table 20](#) and [Figure 10](#), these unconnected pins are indicated with a black diamond symbol (◆).

All the package pins appear in [Table 20](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S50 pinout and the pinout for the XC3S200 and XC3S400, then that difference is highlighted in [Table 20](#). If the table entry is shaded grey, then there is an unconnected pin on the XC3S50 that maps to a user-I/O pin on the XC3S200 and XC3S400. If the table entry is shaded tan, then the unconnected pin on the XC3S50 maps to a VREF-type pin on the XC3S200 and XC3S400. If the other VREF pins in the bank all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S50 to the same VREF voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S50 device to an XC3S200 or XC3S400 FPGA without changing the printed circuit board.

### Pinout Table

*Table 20: PQ208 Package Pinout*

Bank	XC3S50 Pin Name	XC3S200 XC3S400 Pin Name	PQ208 Pin Number	Type

### User I/Os by Bank

Table 21 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S50 in the PQ208 package. Similarly, Table 22 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S200 and XC3S400 in the PQ208 package.

Table 21: User I/Os Per Bank for XC3S50 in PQ208 Package

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	15	9	0	2	2	2
	1	15	9	0	2	2	2

## PQ208 Footprint

### Left Half of Package (top view)

XC3S50

(124 max. user I/O)

72 I/O: Unrestricted, general-purpose user I/O

16 VREF: User I/O or input voltage reference for bank

17 N.C.: Unconnected pins for XC3S50 (◆)

XC3S200, XC3S400

(141 max user I/O)

83 I/O: Unrestricted, general-purpose user I/O

22 VREF: User I/O or input voltage reference for bank

0 N.C.: No unconnected pins in this package

All devices

12 DUAL: Configuration pin, then possible user I/O

8 GCLK: User I/O or global clock buffer input

16 DCI: User I/O or reference resistor input for bank

7 CONFIG: Dedicated configuration pins

4 JTAG: Dedicated JTAG port pins

4 VCCINT: Internal core voltage supply (+1.2V)

12 VCCO: Output voltage supply for bank

8 VCCAUX: Auxiliary voltage supply (+2.5V)

28 GND: Ground

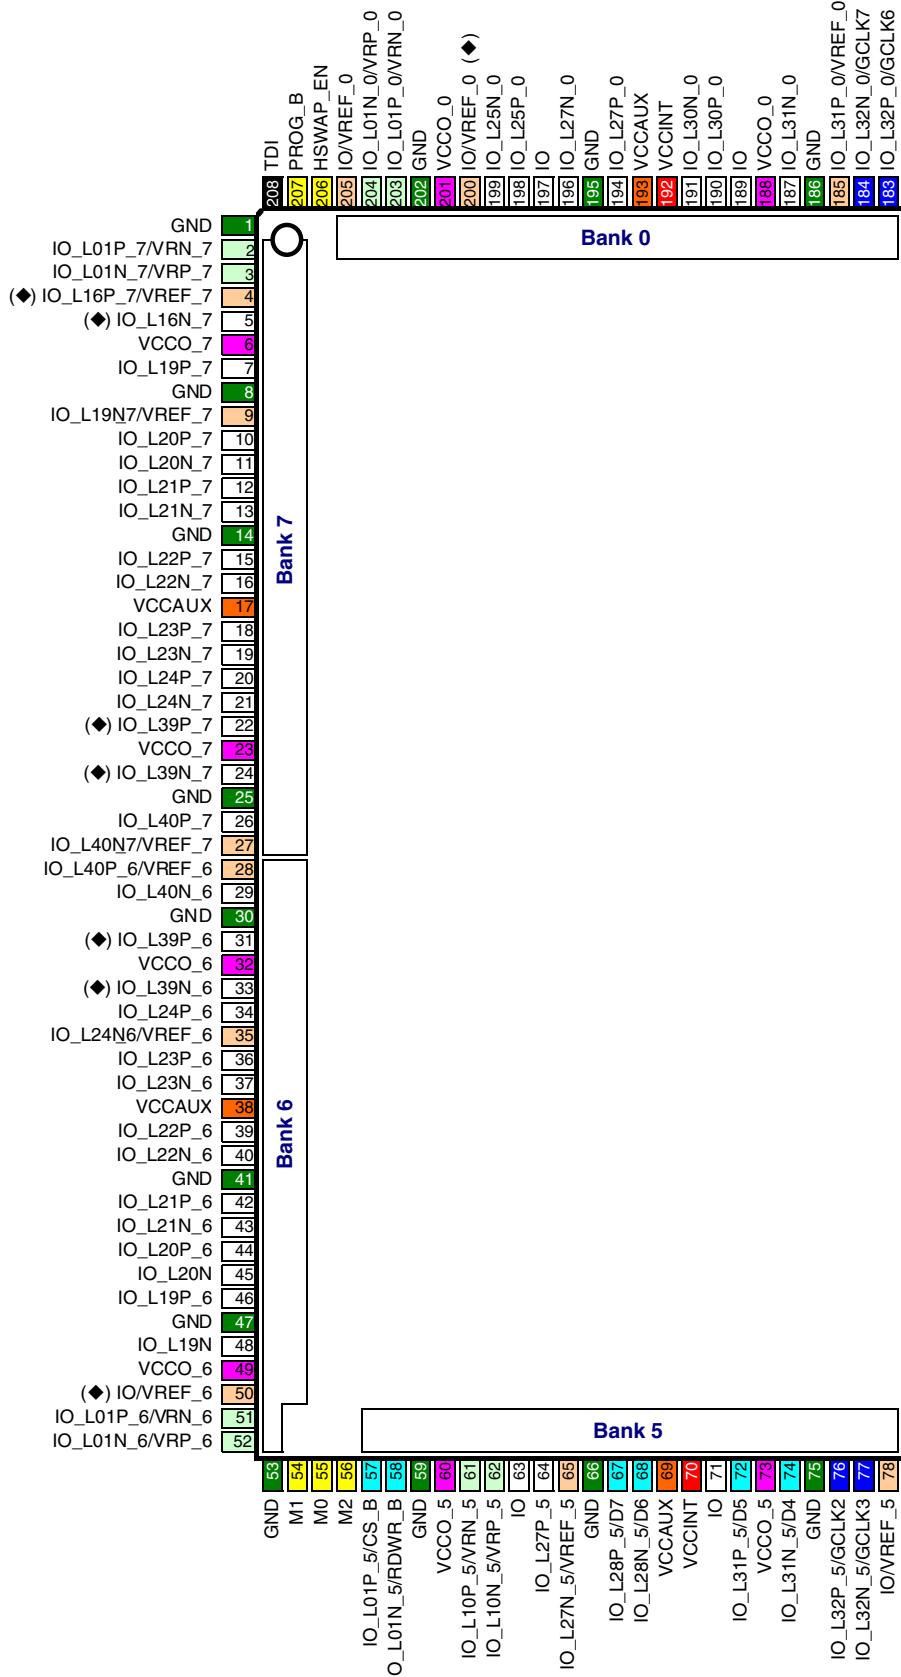

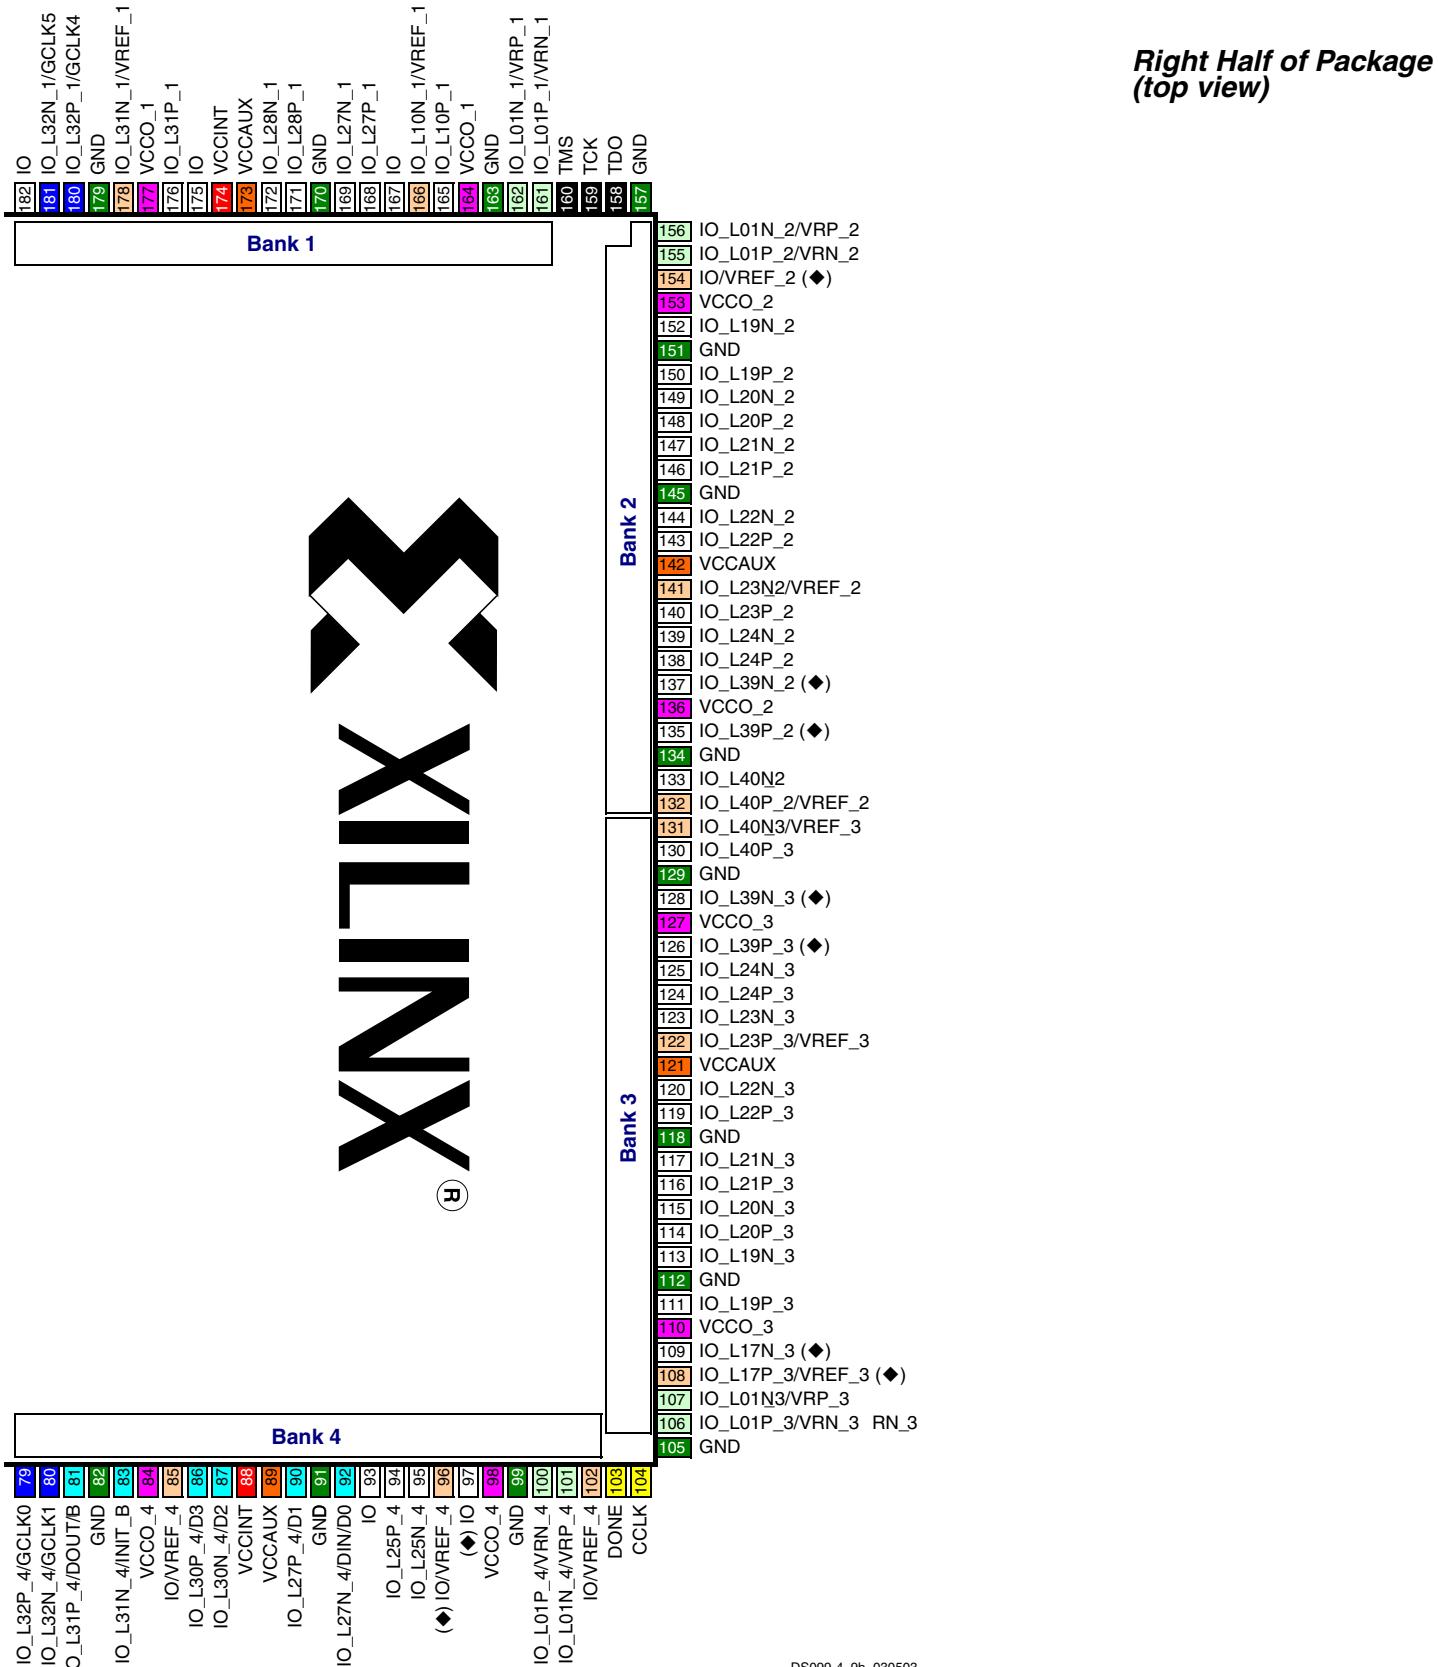

Figure 10: PQ208 Package Footprint (top view). Note pin 1 indicator in top-left corner and logo orientation.

## FT256: 256-lead Fine-pitch Thin Ball Grid Array

The 256-lead fine-pitch thin ball grid array package, FT256, supports three different Spartan-3 devices, including the XC3S200, the XC3S400, and the XC3S1000. The footprints for all three devices are identical, as shown in [Table 23](#) and [Figure 11](#).

All the package pins appear in [Table 23](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

### Pinout Table

*Table 23: FT256 Package Pinout*

Bank	XC3S200 XC3S400 XC3S1000 Pin Name	FT256 Pin Number	Type

### User I/Os by Bank

Table 24 indicates how the available user-I/O pins are distributed between the eight I/O banks on the FT256 package.

**Table 24: User I/Os Per Bank in FT256 Package**

Package Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	20	13	0	2	3	2
	1	20	13	0	2	3	2
Right	2	23	18	0	2	3	0
	3	23	18	0	2	3	0
Bottom	4	21	8	6	2	3	2
	5	20	7	6	2	3	2
Left	6	23	18	0	2	3	0
	7	23	18	0	2	3	0

## FT256 Footprint

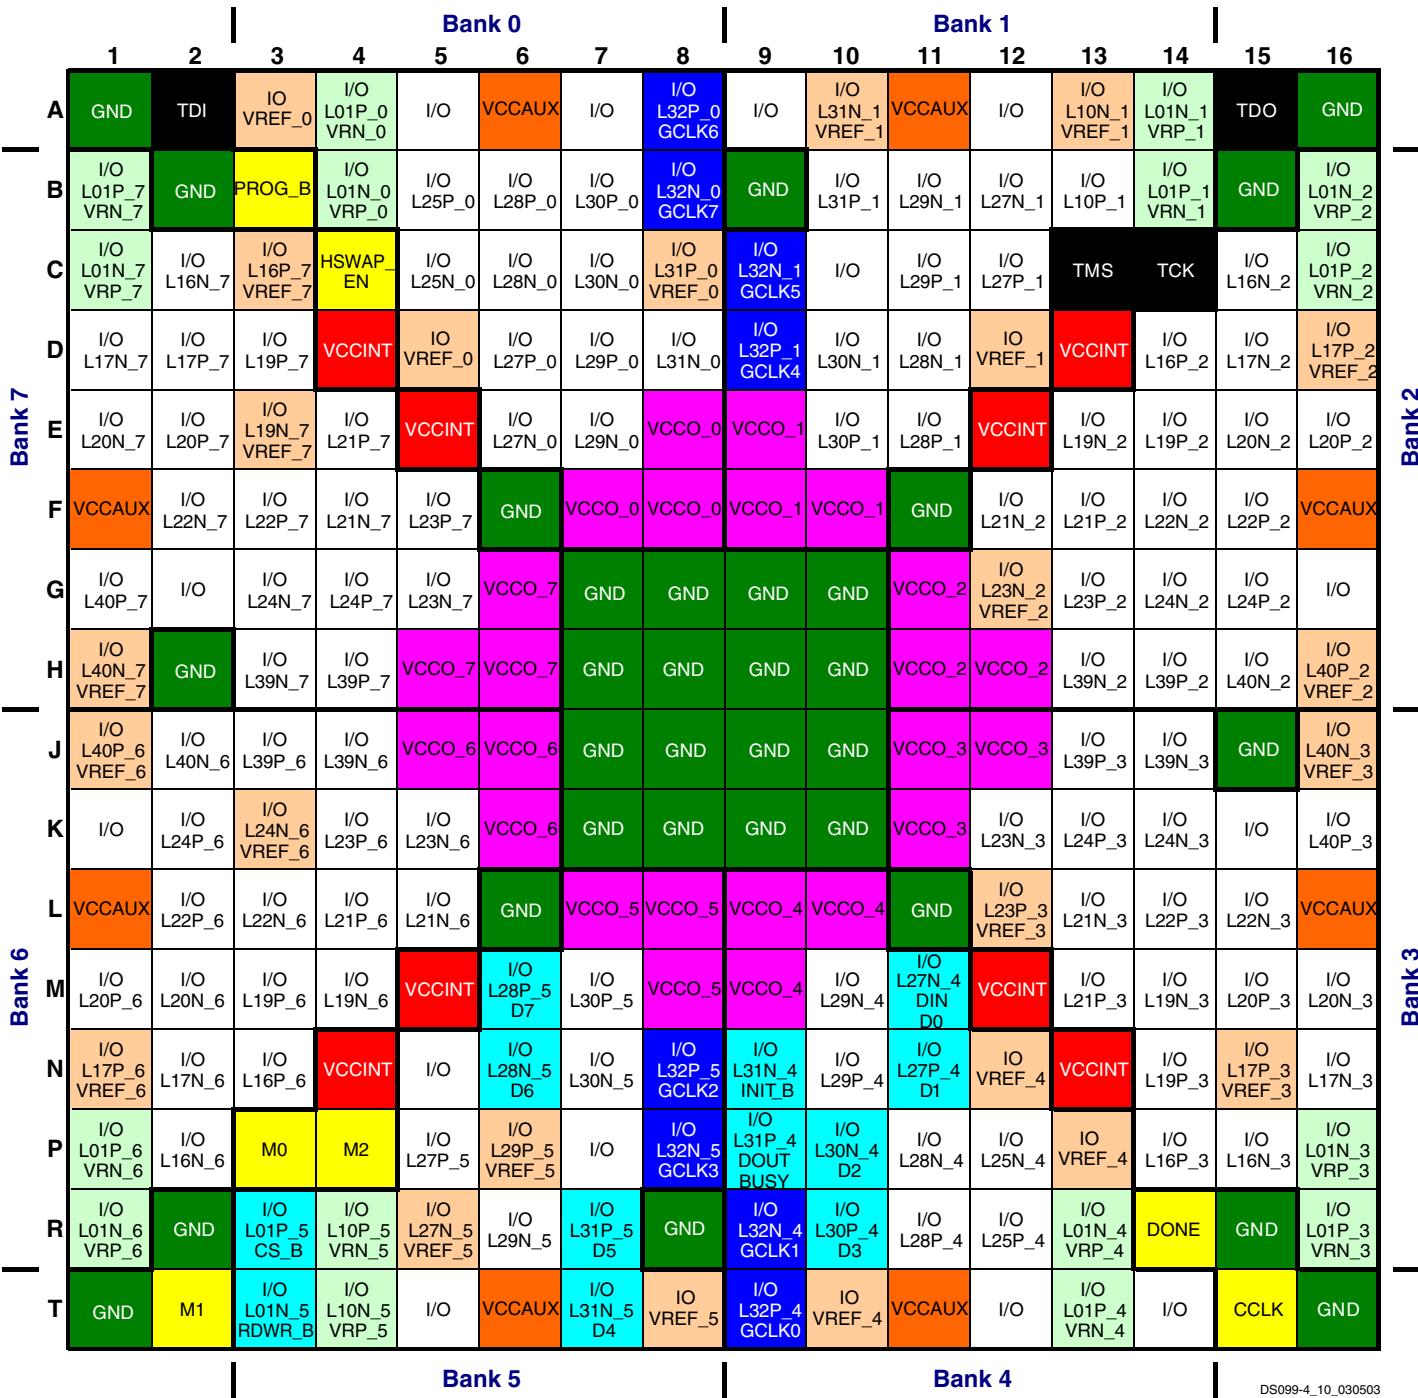

Figure 11: FT256 Package Footprint (top view)

- |     |  |    |   |    |  |
|-----|--|----|---|----|--|
| 113 | I/O: Unrestricted, general-purpose user I/O        | 12 | DUAL: Configuration pin, then possible user I/O | 24 | VREF: User I/O or input voltage reference for bank |
| 16  | DCI: User I/O or reference resistor input for bank | 8  | GCLK: User I/O or global clock buffer input     | 24 | VCCO: Output voltage supply for bank               |
| 7   | CONFIG: Dedicated configuration pins               | 4  | JTAG: Dedicated JTAG port pins                  | 8  | VCCINT: Internal core voltage supply (+1.2V)       |
| 0   | N.C.: No unconnected pins in this package          | 32 | GND: Ground                                     | 8  | VCCAUX: Auxiliary voltage supply (+2.5V)           |

## FG456: 456-lead Fine-pitch Ball Grid Array

The 456-lead fine-pitch ball grid array package, FG456, supports three different Spartan-3 devices, including the XC3S400, the XC3S1000, and the XC3S1500. The footprints for the XC3S1000 and XC3S1500 are identical, as shown in [Table 25](#) and [Figure 12](#). The XC3S400, however, has fewer I/O pins which consequently results in 69 unconnected pins on the FG456 package, labeled as “N.C.” In [Table 25](#) and [Figure 12](#), these unconnected pins are indicated with a black diamond symbol (◆).

All the package pins appear in [Table 25](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S400 pinout and the pinout for the XC3S1000 and XC3S1500, then that difference is highlighted in [Table 25](#). If the table entry is shaded grey, then there is an unconnected pin on the XC3S400 that maps to a user-I/O pin on the XC3S1000 and XC3S1500. If the table entry is shaded tan, then the unconnected pin on the XC3S400 maps to a VREF-type pin on the XC3S1000 and XC3S1500. If the other VREF pins in the bank all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S400 to the same VREF voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S400 device to an XC3S1000 or XC3S1500 FPGA without changing the printed circuit board.

### Pinout Table

## User I/Os by Bank

Table 26 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S400 in the FG456 package. Similarly, Table 27 shows how the avail-

able user-I/O pins are distributed between the eight I/O banks for the XC3S1000 and XC3S1500 in the FG456 package.

Table 26: User I/Os Per Bank for XC3S400 in FG456 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK

## FG676: 676-lead Fine-pitch Ball Grid Array

The 676-lead fine-pitch ball grid array package, FG676, supports three different Spartan-3 devices, including the XC3S1000, the XC3S1500, and the XC3S2000. All three have nearly identical footprints but are slightly different due to unconnected pins on the XC3S1000 and XC3S1500. For example, because the XC3S1000 has fewer I/O pins, this device has 98 unconnected pins on the FG456 package, labeled as "N.C." In [Table 28](#) and [Figure 13](#), these unconnected pins are indicated with a black diamond symbol (◆). The XC3S1500, however, has only two unconnected pins, also labeled "N.C." in the pinout table but indicated with a black square symbol (■).

All the package pins appear in [Table 28](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC1000, XC3S1500 and XC3S2000 pinouts, then that difference is highlighted in [Table 28](#). If the table entry is shaded grey, then there is an unconnected pin on either the XC3S1000 or XC3S1500 that maps to a user-I/O pin on the XC3S2000. If the table entry is shaded tan, then the unconnected pin on either the XC3S1000 or XC3S1500 maps to a VREF-type pin on the XC3S2000. If the other VREF pins in the bank all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S1000 or XC3S1500 to the same VREF voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S1000 through to the XC3S2000 FPGA without changing the printed circuit board.

### User I/Os by Bank

Table 29 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S1000 in the FG676 package. Similarly, Table 30 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S1500 in the FG676 package. Finally, Table 31 shows the same information for the XC3S2000 in the FG676 package.

Table 29: User I/Os Per Bank for XC3S1000 in FG676 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	49	40	0	2	5	2
	1	50	41	0	2	5	2
Right	2	48	41	0	2	5	0
	3	48	41	0	2	5	0
Bottom	4	50	35	6	2	5	2
	5	50	35	6	2	5	2
Left	6	48	41	0	2	5	0
	7	48	41	0	2	5	0

Table 30: User I/Os Per Bank for XC3S1500 in FG676 Package

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	62	52	0	2	6	2

## FG676 Footprint

### Left Half of Package (top view)

#### XC3S1000

(391 max. user I/O)

**315** I/O: Unrestricted, general-purpose user I/O

**40** VREF: User I/O or input voltage reference for bank

**98** N.C.: Unconnected pins for XC3S1000 (◆)

#### XC3S1500

(487 max user I/O)

**403** I/O: Unrestricted, general-purpose user I/O

**48** VREF: User I/O or input voltage reference for bank

**2** N.C.: Unconnected pins for XC3S1500 (■)

#### XC3S2000

(489 max user I/O)

**405** I/O: Unrestricted, general-purpose user I/O

**48** VREF: User I/O or input voltage reference for bank

**0** N.C.: No unconnected pins

### All devices

**12** DUAL: Configuration pin, then possible user I/O

**8** GCLK: User I/O or global clock buffer input

**16** DCI: User I/O or reference resistor input for bank

**7** CONFIG: Dedicated configuration pins

**4** JTAG: Dedicated JTAG port pins

**20** VCCINT: Internal core voltage supply (+1.2V)

**64** VCCO: Output voltage supply for bank

**16** VCCAUX: Auxiliary voltage supply (+2.5V)

**76** GND: Ground

## FG900: 900-lead Fine-pitch Ball Grid Array

The 900-lead fine-pitch ball grid array package, FG900, supports three different Spartan-3 devices, including the XC3S2000, the XC3S4000, and the XC3S5000. The footprints for the XC3S4000 and XC3S5000 are identical, as shown in [Table 32](#) and [Figure 14](#). The XC3S2000, however, has fewer I/O pins which consequently results in 68 unconnected pins on the FG900 package, labeled as “N.C.” In [Table 32](#) and [Figure 14](#), these unconnected pins are indicated with a black diamond symbol (◆).

All the package pins appear in [Table 32](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S2000 pinout and the pinout for the XC3S4000 and XC3S5000, then that difference is highlighted in [Table 32](#). If the table entry is shaded, then there is an unconnected pin on the XC3S2000 that maps to a user-I/O pin on the XC3S4000 and XC3S5000.

### Pinout Table

## User I/Os by Bank

**Table 33** indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S2000 in the FG900 package. Similarly, **Table 34** shows how the

available user-I/O pins are distributed between the eight I/O banks for the XC3S4000 and XC3S5000 in the FG900 package.

**Table 33: User I/Os Per Bank for XC3S2000 in FG900 Package**

Edge	I/O Bank	Maximum I/O	All Possible I/O Pins by Type				
			I/O	DUAL	DCI	VREF	GCLK
Top	0	71	62	0	2	5	2
	1	71	62	0	2	5	2

## FG900 Footprint

### Left Half of Package (top view)

#### XC3S2000

(565 max. user I/O)

**481** **I/O:** Unrestricted, general-purpose user I/O

**48** **VREF:** User I/O or input voltage reference for bank

**68** **N.C.:** Unconnected pins for XC3S2000 (◆)

#### XC3S4000, XC3S5000

(633 max user I/O)

**549** **I/O:** Unrestricted, general-purpose user I/O

**48** **VREF:** User I/O or input voltage reference for bank

**0** **N.C.:** No unconnected pins in this package

#### All devices

**12** **DUAL:** Configuration pin, then possible user I/O

**8** **GCLK:** User I/O or global clock buffer input

**16** **DCI:** User I/O or reference resistor input for bank

**7** **CONFIG:** Dedicated configuration pins

**4** **JTAG:** Dedicated JTAG port pins

**32** **VCCINT:** Internal core voltage supply (+1.2V)

**80** **VCCO:** Output voltage supply for bank

**24** **VCCAUX:** Auxiliary voltage supply (+2.5V)

**120** **GND:** Ground

## FG1156: 1156-lead Fine-pitch Ball Grid Array

The 1,156-lead fine-pitch ball grid array package, FG1156, supports two different Spartan-3 devices, namely the XC3S4000, and the XC3S5000. The XC3S2000, however, has fewer I/O pins, which consequently results in 73 unconnected pins on the FG1156 package, labeled as "N.C." In [Table 35](#) and [Figure 15](#), these unconnected pins are indicated with a black diamond symbol (◆).

The XC3S5000 has a single unconnected package pin, ball AK31, which is also unconnected for the XC3S4000.

All the package pins appear in [Table 35](#) and are sorted by bank number, then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

If there is a difference between the XC3S2000 and XC3S5000 pinouts, then that difference is highlighted in [Table 35](#). If the table entry is shaded grey, then there is an unconnected pin on the XC3S2000 that maps to a user-I/O pin on the XC3S4000 and XC3S5000. If the table entry is shaded tan, which only occurs on ball L29 in I/O Bank 2, then the unconnected pin on XC3S4000 maps to a VREF-type pin on the XC3S5000. If the other VREF\_2 pins all connect to a voltage reference to support a special I/O standard, then also connect the N.C. pin on the XC3S4000 to the same VREF\_2 voltage. This provides maximum flexibility as you could potentially migrate a design from the XC3S4000 to the XC3S5000 FPGA without changing the printed circuit board.

### Pinout Table

*Table 35: FG1156 Package Pinout*

## User I/Os by Bank

Table 36 indicates how the available user-I/O pins are distributed between the eight I/O banks for the XC3S4000 in the FG1156 package. Similarly, Table 37 shows how the available user-I/O pins are distributed between the eight I/O banks for the XC3S5000 in the FG1156 package.

## Revision History

Date	Version No.	Description
04/03/03	1.0	Initial Xilinx release.
04/21/03	1.1	<p>Added information on the VQ100 package footprint, including a complete pinout table (<a href="#">Table 16</a>) and footprint diagram (<a href="#">Figure 8</a>).</p> <p>Updated <a href="#">Table 15</a> with final I/O counts for the VQ100 package. Also added final differential I/O pair counts for the TQ144 package.</p> <p>Added clarifying comments to HSWAP_EN pin description on <a href="#">page 13</a>.</p> <p>Updated the footprint diagram for the FG900 package shown in <a href="#">Figure 14a</a> and <a href="#">Figure 14b</a>. Some thick lines separating I/O banks were incorrect.</p> <p>Made cosmetic changes to <a href="#">Figure 1</a>, <a href="#">Figure 3</a>, and <a href="#">Figure 4</a>.</p> <p>Updated Xilinx hypertext links.</p> <p>Added XC3S200 and XC3S400 to Pin Name column in <a href="#">Table 18</a>.</p>
05/12/03	1.1.1	AM32 pin was missing GND label in FG1156 package diagram ( <a href="#">Figure 15</a> ).
07/11/03	1.1.2	Corrected misspellings of GCLK in <a href="#">Table 1</a> and <a href="#">Table 2</a> . Changed CMOS25 to LVCMOS25 in <b>Dual-Purpose Pin I/O Standard During Configuration</b> section. Clarified references to Module 2. For XC3S5000 in FG1156 package, corrected N.C. symbol to a black square in <a href="#">Table 35</a> , key, and package drawing.
07/29/03	1.2	Corrected pin names on FG1156 package. Some package balls incorrectly included LVDS pair names. The affected balls on the FG1156 package include G1, G2, G33, G34, U9, U10, U25, U26, V9, V10, V25, V26, AH1, AH2, AH33, AH34. The number of LVDS pairs is unaffected. Modified affected balls and re-sorted rows in <a href="#">Table 35</a> . Updated affected balls in <a href="#">Figure 15</a> . Also updated ASCII and Excel electronic versions of FG1156 pinout.
